

Siding

Nothing will impact the appearance of your home more dramatically than the exterior siding you choose. A building's exterior walls are its most evident and defining features, and you'll want them to make a great first impression. As you shop for exterior siding, look for a siding material that suits the style of your house and also fits your lifestyle.

Wood

Traditionally, the most popular siding material in North America has been solid wood siding. Wood siding is available in boards (both horizontal and vertical) or shingles. Shingles offer a rustic look but are typically higher in price. Many of these products are made from mature cedar, redwood and other species that are resistant to water and insects.

Profiles and other info.

Profile: Bevel or Lap siding

Western Red Cedar Bevel Siding, C-Clear, 1/8" x 1/2" x 6" (Net 5-1/2" face width) x RL (8'-16'). Resawn face/smooth face. Fine grain. Larger volumes available.

Maintenance

Whereas wood siding does offer a classically traditional appearance to your home, because of its porous, organic nature, wood has a tendency to absorb and expel water, which may cause deterioration over time. While initially attractive, this siding material requires frequent maintenance. Keep in mind, however, that all siding requires yearly maintenance, and the amount of maintenance depends on the installation methods used.
