GENERAL INFORMATION

CCU+[™]

Critical Connection Undercut Anchoring System

PRODUCT DESCRIPTION

The DEWALT Critical Connection Undercut (CCU+[™]) anchor is a post-installed structural anchor designed for static, dynamic and seismic loading in the tension zone of both cracked and uncracked concrete. The high capacity CCU+[™] anchor can be loaded immediately following installation and is available in zinc plated ASTM A36 (F1554 Grade 36) mild carbon steel and ASTM A193 Grade B7 high strength carbon steel. For exterior applications or where high corrosion resistance is required, the CCU+[™] is also available in ASTM A193 Grade 8BM, Class 2 high strength 316 stainless steel.

CCU+ anchors are installed into a fixed depth hole with a cone-shaped cavity at the bottom which is created in a secondary drilling operation using a specialty undercut drill bit supplied by DEWALT. The result is bottom-bearing post-installed anchor which keys into the base material with minimal expansive forces allowing for close edge distance and anchor spacing, similar to a cast-in-place headed stud. The heavy-wall expansion sleeve contributes to load transfer and improved shear capacities particularly for the thrubolt version.

GENERAL APPLICATIONS AND USES

- Structural connections (e.g. beam, column)
- Safety related fastening and assemblies
- Bridge, tunnel and port structure attachments
- Water and wastewater treatment facility units
- Vessel, tank and containment wall anchorage
- Power generation plant / hydro dam anchors

FEATURE AND BENEFITS

- + Load transfers to concrete through bearing not friction (similar to cast-in headed bolts)
- + Provides positive mechanical interlock into base material
- + Consistent predictable behavior and exceptional load capacities
- + Robust design minimizes anchor displacement under load
- + Anchor bearing area is more than two-and-a-half times the net tensile area of the anchor rod
- + Anchor rods can be designed for stretch length and ductile steel behavior for seismic loading
- + Close edge distance, anchor spacing, and slab thickness due to low expansive forces
- + Thrubolt version provides significant increase in shear capacities and variable fixture thickness
- + Length ID code and material ID marking stamped on head of each anchor
- + Undercut cavity is created in seconds with durable undercutting tool
- + DEWALT dust removal drilling system (with HEPA dust extractor) can be used for an OSHA 1926.1153 Table 1 compliant solution
- + CCU+ undercut anchors made in USA at time of publication; product certifications available by request (anchors@DEWALT.com)

APPROVALS AND LISTINGS

- International Code Council, Evaluation Service (ICC-ES), ESR-4810 and ELC-4810 for cracked and uncracked concrete
- Code compliant with the 2021 IBC/IRC, 2018 IBC/IRC, 2015 IBC/IRC and 2012 IBC/IRC
- Tested in accordance with ACI 355.2/ASTM E488 and ICC-ES AC193 for use in structural concrete under the design provisions of ACI 318 (-19 and -14) Chapter 17, CSA A23.3-19 Annex D or ACI 318-11 Appendix D
- Evaluated and qualified by an accredited independent testing laboratory for recognition in cracked and uncracked concrete including seismic and wind loading (anchor category 1 for all sizes)
- City of Los Angeles, LABC Supplement (within ESR-4810)
- Florida Building Code, FBC Supplement including HVHZ (within ESR-4810)

GUIDE SPECIFICATIONS

CSI Divisions: 03 16 00 – Concrete Anchors and 05 05 19 – Post-Installed Concrete Anchors. Undercut anchors shall be CCU+ as supplied by DEWALT, Towson, MD. Anchors shall be installed in accordance with published instructions and the Authority Having Jurisdiction.

1. Preset anchors are designed so the top of the expansion sleeve is approximately flush with the base material after setting. Thrubolt anchors are designed so the expansion sleeve can be set through and can engage the fixture. See CCU+ undercut anchor detail and installation specifications.

2. Anchor rod (threaded rod) conforming to ASTM F1554, Grade 105 is strength equivalent to the tabulated ASTM A193, Grade B7 designation.

 The listed anchor lengths are based on the anchor sizes commercially available at the time of publication; custom lengths can be produced by request. Custom length anchors not long enough to meet the minimum embedment requirements are outside the scope of ICC-ES ESR-4810 and ELC-4810.

IVIEAN AXIAI SUIMESS"	cracked concrete	$eta_{ m cr}$	lbf/in.		398,000			744,000			445,000			354,000	

For SI: 1 inch = 25.4 mm, 1 ft-lbf = 1.356 N-m.

1. The embedment depth, hnom, is measured from the outside surface of the concrete member to the embedded end of the anchor and equal to the hole depth.

For thrubolt applications the actual hole depth, h_{0.act} is dependent on the actual fixture thickness, t_{mx}. Actual hole depth for thrubolts is determined by taking the minimum hole depth plus the
maximum thickness of fixture for the selected anchor less the actual fixture thickness being fastened to the base material (h_{0.act} = h₀ + t_{max} - t_m).

3. For thrubolt applications the minimum concrete member thickness, hmin.act is dependent on the actual fixture thickness, tm. Minimum concrete member thickness for thrubolts is determined by taking the minimum concrete member thickness plus the maximum thickness of fixture for the selected anchor less the actual fixture thickness being fastened to the base material (hmin.act = hmin + tmax - tmx).

4. The anchor rod for the 3/8-inch stainless steel anchors is manufactured with a minimum specified ultimate strength of 120 ksi (827 N/mm²).

5. For CCU+ undercut anchors, the anchor rod, d_{rod} replaces the outside anchor diameter, d_a (i.e. expansion sleeve diameter, d_a) for determination of stretch length and stretch length ratio. Stretch lengths of the anchor rod (threaded rod) in anchor assemblies for embedments listed are greater than eight anchor rod diameters, 8d_{rod} which meets the prescriptive requirements as given in ACI 318-19 17.10.5.3(a), ACI 318-14 17.2.3.4.3(a) and ACI 318-11 D.3.3.4.3(a) and CSA A23.3-19, and CSA A23.3-19.

6. Mean values shown, actual stiffness varies considerably depending on concrete strength, loading and geometry of application.

1. The data	in this table is intended to be used with	the design	provisions	of CSA A2	3.3 (-19) /	Annex D, a	s applicab	le; for and	hors resist	ting seism	ic load con	nbinations	the additi	onal requii	rements			

isions of CSA A23.3 (-19) Annex D, as applicable; for anchors resisting seismic load comb of CSA A23.3 (-19) D.4.3, as applicable, must apply.

 CSA A23.3 (-19) D.4.3, as applicable, intext apply.
 Installation must comply with published instructions and details.
 All values of R for use with the load combinations of Division B, Part 4, Section 4.1.3 of the 2015 NBCC or 2010 NBCC, CSA A23.3 (-19) Annex C, as applicable, Conditon B applies where supplementary reinforcement in comformance with CSA A23.3 (-19 D.3.3(c), as applicable, is not provided, or where pullout or pryout strength governs. For cases where the presence of supplementary reinforcement can be verified, the strength reduction factors associated with Condition A may be used. 4.

The CCU+ undercut anchor is considered a ductile steel element as defined by CSA A23.3(-19) D.2, as applicable.

5. For all design cases $\Psi_{e,N} = 1.0$. The appropriate effectiveness factor for cracked concrete (K_{cr}) or uncracked concrete (K_{uncr}) must be used. 6. For all design cases use $\Psi_{e,P} = 1.0$. For the calculation of Nerr, see CSA A23.3 (-19) D.6.3.

7. Pullout strength does not control design of indicated anchors. Do not calculate pullout strength for indicated sizes and embedment.

8. Anchors are permitted to be used in lightweight concrete in accordance with CSA A23.3 (-19) D.4.6.

Tabulated values for steel strength in shear are for seismic applications and based on test results in accordance with ACI 355.2 (Section 9.6), as referenced in CSA A23.3 (-19) Annex D, Section D.4.3.4. 9.

- Anchor Pullout/Pryout Strength Controls - Concrete Breakout Strength Controls - Steel Strength Controls

1- Tabular values are provided for illustration and are applicable for single anchors installed in normal-weight concrete with minimum slab thickness, ha = 1.5*hmin, and with the following conditions:

2- Calculations were performed following methodology in CSA A23.3-19, Annex D. The load level corresponding to the failure mode listed (e.g. For tension: steel, concrete breakout and pullout; For shear: steel, concrete breakout and pryout). Furthermore, the capacities for concrete breakout strength in tension and pryout in shear are calculated using the effective embedment values, her, for the selected anchors as noted in the design information tables. Please also reference the installation specifications for more information.

3- Material Resistance factors (ø) are in accorace with CSA A23.3-19, Sections 8.4.2 and 8.4.3. Mondification Factors (R) are in accordance with CSA A23.3-19 Annex D, Section D.5.3 Condition B; it is assumed that supplementary reinforcement not present. Material resistance factors for steel strength are taken as 0.85 for tension and shear; Modification factors are taken as 0.80 for Tension and 0.75 for Shear; values correspond to ductile steel elements.

4- Tabular values are permitted for short-term static loads only, seismic loading is not considered with these tables.

5- For designs that include combined tension and shear, the interaction of tension and shear loads must be calculated in accordance with CSA A23.3-19 Annex D, Section D.8.

6- Interpolation is not permitted to be used with the tabular values. For intermediate base material compressive strengths, please see CSA A23.3 Annex D and information contained in this product supplement. For other design conditions including seismic considerations please see CSA A23.3 Annex D.

1. Allowable load values are calculated using a conversion factor, α , from the Factored Design Strength Tables and conditions shown previously.

2. Tabulated allowable load values assume 50% dead load and 50% live load, with controlling load combination 1.2D + 1.6L.

Calculated weighted average for the conversion factor α : 1.2(0.5) + 1.6(0.5) = 1.4.

1. Allowable load values are calculated using a conversion factor, α , from the Factored Design Strength Tables and conditions shown previously.

2. Tabulated allowable load values assume 50% dead load and 50% live load, with controlling load combination 1.2D + 1.6L.

Calculated weighted average for the conversion factor α : 1.2(0.5) + 1.6(0.5) = 1.4.

Notes for Anchor Ordering Information Tables:

1. Standard preset anchors are designed so the top of the expansion sleeve is approximately flush with the base material after setting. Thrubolt anchors are designed so the expansion sleeve can be set through and can engage the fixture. See CCU+ undercut anchor detail and installation specifications.

2. Undercut drill bits and setting sleeves are required for installation. See the available anchor installation accessories and tools commercially available from DEWALT at the time of publication.

3. The listed anchor lengths are based on the anchor sizes commercially available at the time of publication; custom lengths can be produced by request.

1-800-4 DEWALT

DFX11120	13/16	5-3/8	SDS-Plus	1	
DFX11580	1	8	SDS-Max	1	
DFX11340	1-1/4	10-5/8	SDS-Max	1	
Stop drill bits create a drilled hole to the specified depth for standard preset version CCU+ Undercut anchors. For thrubolt applications, see CCU+ undercut anchor detail and installation specifications.					

HSB dust removal drill bits are used with a vacuum dust extractor (e.g. DWV010, DWV012, DWV015, DCV585).

Hollow Bits (HB)

Cat. No.	Nominal Drill Bit Diameter, (in.)	Usable Length, (in.)	Shank Type	Pack Qty.		
DWA54116	11/16	9-3/4	SDS-Plus	1		
DWA54316	13/16	9-3/4	SDS-Plus	1		
DWA58001	1	15-3/4	SDS-Max	1		
DWA58115	1-1/4	15-3/4	SDS-Max	1		
HB dust removal drill bits a	HB dust removal drill bits are used with a vacuum dust extractor (e.g. DWV010, DWV012, DWV015, DCV585).					

Conventional Bits (4-Cutter)

Cat. No.	Nominal Drill Bit Diameter, (in.)	Usable Length, (in.)	Shank Type	Pack Qty.
DW5808	11/16	16	SDS-Max	1
DW5814	13/16	16	SDS-Max	1
DW5852	1	24	SDS-Max	1
DW5855	1-1/4	24	SDS-Max	1
