LP SOLIDSTART I-JOISTS LIGHT-FRAME COMMERCIAL AND MULTIFAMILY CONSTRUCTION U.S. TECHNICAL GUIDE

LPI® 36, 42Plus, 52Plus and 56 Series

U.S. Technical Guide

Light-Frame Commercial and Multifamily Building Products from LP Building Products.

LP® SolidStart® ENGINEERED WOOD PRODUCTS. ADVANTAGES YOU CAN USE.

LP SolidStart Engineered Wood Products provide solid, true and uniform building solutions for not only residential construction but for light-frame commercial and multifamily projects as well.

Our products deliver sustainability benefits and cost efficiencies that traditional lumber can't match. They offer superior strength, durability and consistency. They cut and work just like traditional wood. And they resist cupping, warping, twisting and shrinking. So you save time and money during construction while delivering advantages your customers will enjoy for years to come. This guide features design information especially for builders using our engineered wood products in light-frame commercial and multifamily construction.

LIFETIME LIMITED WARRANTY

LP SolidStart Engineered Wood Products are backed by a lifetime limited warranty. Visit LPCorp.com or call 1.888.820.0325 for a copy of the warranty.

NOTES:

LP[®] SolidStart[®] I-Joists shall be designed for dry-use conditions only. Dry-use applies to products installed in dry, covered and well ventilated interior conditions in which the equivalent moisture content in lumber will not exceed 16%.

2. Moment and Shear are for normal load duration and shall be adjusted according to code.

3. Moment shall not be increased for repetitive member use.

4. Deflection calculations shall include both bending and shear deformations.

Deflection for a simple span, uniform load:
$$\Delta = \frac{22.5wL^4}{El} + \frac{wL^2}{K}$$
 Where: $\Delta = deflection (in)$
 $w = uniform load (plf)$
 $L = design span (ft)$ EI = bending stiffness (from table)

Equations for other conditions can be found in engineering references.

Product Specifications: Reaction Capacity

REACTION AND BEARING CAPACITY End Reaction Capacity (lbs) Interior Reaction Capacity (Ibs)¹ Flange Bearing Maximum Bearing (5-1/2") Minimum Bearing (see below) Maximum Bearing (4") Minimum Bearing (3-1/2") Series Depth Capacity² (lb/in) With Stiffener Bearing Length With Stiffeners With Stiffener: With Stiffeners W/out Stiffeners W/out Stiffeners W/out Stiffeners W/out Stiffeners 11-7/8" 1-1/2' 1-1/2" 14" LPI 36 16" 1-1/2" 2-1/2" 18" 11-7/8" 1-1/2 14" 1-1/2" 16" 1-1/2" LPI 42Plus 18" 2-1/2" 20" 2-1/2" 2-1/2" 24" 11-7/8" 1-1/2" PI 52Plus 14" 1-1/2" 16" 1-1/2 11-7/8 1-1/2" 14" 1-1/2" LPI 56 16" 1-1/2" 18" 2-1/2' 24" 2-1/2"

NOTES:

- End and Interior Reaction Capacity shall be limited by the Flange Bearing Capacity or the bearing 1. capacity of the support material, whichever is less.
- 2. The Flange Bearing Capacity, per inch of bearing length, is based on the allowable compression perpendicular-to-grain of the I-Joist flange, accounting for eased edges.
- To account for edge easing when determining the bearing capacity of the support material, subtract 0.25" from the flange width for the LPI 42Plus & LPI 52Plus, and subtract 0.10" from the flange width for the LPI 36 & LPI 56.
- 4. Reaction Capacity is for normal load duration and shall be adjusted according to code. Flange Bearing Capacity and the bearing capacity of any wood support shall not be adjusted for load duration.
- Reaction Capacity and Flange Bearing Capacity may be increased over the values tabulated for 5. the minimum bearing length. Linear interpolation of the Reaction Capacity between the minimum and maximum bearing length is permitted. Bearing lengths longer than the maximum do not further increase Reaction Capacity. Flange Bearing Capacity and that of a wood support will increase with additional bearing length.
- 5. See page 16 for information on web stiffeners sizes and nailing.

EXAMPLE:

Determine the stiffened end reaction capacity for a 16" LPI 42Plus with 2" of bearing for a non-snow roof load and supported on an SPF wall plate.

- 1. Determine End Reaction (ER) w/ Stifferners: ER = 1800 + (2115 1800) * (2" 1.5")/(4" 1.5") = 1863 lbs
- 2. Adjust for load duration: Adjusted ER = 1863 * 1.25 = 2328 lbs
- Determine Flange Bearing Capacity (FBC): FBC = 1705 lb/in * 2" = 3410 lbs
- 4.
- Determine wall plate bearing capacity (PBC): PBC = 425 psi * (3.5" 0.25") * 2" = 2762 lbs
- 5. Final End Reaction Capacity w/Stiffeners = 2328 lbs

Uniform Floor Load (PLF) Tables: LPI 36 Simple Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 18'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 19' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
 - Design Live Load = 50 * (24 / 12) = 100 plf
- Select the first joist to exceed both Total Load and L/600: <u>The 18" LPI 36 supports 185 plf Total Load and 114 plf Live Load at L/600</u> NOTE: Web stiffeners required at both end supports.

38'	16	20	27	41	38'

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for simple span applications only.
 The values in the tables are for uniform loads only. Concentrated loads, where required,
- shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not been considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check both the Total Load and the appropriate Live Load column.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 36 Continuous Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

An I-Joist has the continuous clear spans of 20'-8" and 22'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit. 1. Select the row corresponding to a 23' span (longest of the spans).

- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
- Design Live Load = 50 * (24 / 12) = 100 plf
- Select the first joist to exceed both Total Load and L/600:

Cannot use the LPI 36 series - exceeds Total Load for all depths at 23'

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- 2. The values in the tables are for uniform loads only. Concentrated loads, where required, shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- 6. Total Load deflection is limited to L/240. Long term deflection (creep) has not
- been considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\,1} = 425$ psi).

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- The designer shall check both the Total Load and the appropriate Live Load column.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked "*", then web stiffeners are also required at both end supports.
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 42Plus Simple Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 22'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 23' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
 - Design Live Load = 50 * (24 / 12) = 100 plf
- Select the first joist to exceed both Total Load and L/600: <u>The 20" LPI 42Plus supports 180 plf Total Load and 106 plf Live Load at L/600</u> NOTE: Web stiffeners required at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for simple span applications only.
 The values in the tables are for uniform loads only. Concentrated loads, where required,
- shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not been considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.

- 2. The designer shall check both the Total Load and the appropriate Live Load column.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 42Plus Continuous Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 22'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 23' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
 - Design Live Load = 50 * (24 / 12) = 100 plf Select the first joist to exceed both Total Load and L/600:

 Select the first joist to exceed both Total Load and L/600: <u>The 20" LPI 42Plus supports 151 plf Total Load and 137 plf Live Load at L/600</u> NOTE: Web stiffeners required at the intermediate support and at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- 2. The values in the tables are for uniform loads only. Concentrated loads, where required, shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not
- been considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\, L} = 425$ psi).

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check both the Total Load and the appropriate Live Load column.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked "*", then web stiffeners are also required at both end supports.
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 52Plus Simple Spans

TO USE:

- 1. Select the span required.
- 2. Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 19'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 20' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
- Design Live Load = 50 * (24 / 12) = 100 plf
 - Select the first joist to exceed both Total Load and L/600:
- 3. The 16" LPI 52Plus supports 212 plf Total Load and 111 plf Live Load at L/600 NOTE: Web stiffeners required at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for simple span applications only. 1.
- The values in the tables are for uniform loads only. Concentrated loads, where required, 2.
- shall be evaluated by the designer. 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- 6. Total Load deflection is limited to L/240. Long term deflection (creep) has not been considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16," and are limited to the bearing capacity for an 8. SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length. 1. The designer shall check both the Total Load and the appropriate Live Load column 2.

- 3. To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- Web stiffeners are not required where only one value is shown for Total Load or when the design total 4 load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- 5. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 52Plus Continuous Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 19'-6," supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 20' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
 - Design Live Load = 50 * (24 / 12) = 100 plf

 Select the first joist to exceed both Total Load and L/600: <u>The 14" LPI 52Plus supports 167 plf Total Load and 108 plf Live Load at L/600</u> NOTE: Web stiffeners required at the intermediate support and at both end supports.

38'	-	-	-	-	-	-	-	-	23	29	39	59	38'

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The values in the tables are for uniform loads only. Concentrated loads, where required, shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not been considered.
- These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16° and at least 2-1/2" for depths greater than 16° an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp} = 425$ psi).

ADDITIONAL NOTES:

The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
 The designer shall check both the Total Load and the appropriate Live Load column.

- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked "*", then web stiffeners are also required at both end supports.
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 56 Simple Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 22'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 23' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
- Design Live Load = 50 * (24 / 12) = 100 plf
- Select the first joist to exceed both Total Load and L/600: <u>The 18" LPI 56 supports 196 plf Total Load and 102 plf Live Load at L/600</u> NOTE: Web stiffeners required at both end supports.

DESIGN ASSUMPTIONS:

1. Span is the clear distance between supports for simple span applications only.

- The values in the tables are for uniform loads only. Concentrated loads, where required, shall be evaluated by the designer.
- Total Load is for normal (100%) duration.
- These tables do not reflect any additional stiffness provided by the floor sheathing.
- Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not been
- considered.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp} = 425$ psi).

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check both the Total Load and the appropriate Live Load column.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection detail on page 15.
- 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 6. Where the Live Load is blank, the Total Load governs the design.
- 7. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Floor Load (PLF) Tables: LPI 56 Continuous Spans

TO USE:

- 1. Select the span required.
- Compare the design total load to the Total Load column. Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- 3. Compare the design live load to the appropriate Live Load column.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.
- 6. Concentrated loads, where required, shall be evaluated by the designer.

EXAMPLE:

- An I-Joist has the simple clear span of 22'-6", supporting 50 psf Floor Load and 25 psf Dead Load, spaced 24" oc. Select the shallowest joist that satisfies an L/600 live load deflection limit.
- 1. Select the row corresponding to a 23' span.
- 2. Design Total Load = (50 + 25) * (24 / 12) = 150 plf
- Design Live Load = 50 * (24 / 12) = 100 plf

 Select the first joist to exceed both Total Load and L/600: <u>The 18" LPI 56 supports 151 plf Total Load and 132 plf Live Load at L/600</u> NOTE: Web stiffeners required at the intermediate support and at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The values in the tables are for uniform loads only. Concentrated loads, where required, shall be evaluated by the designer.
- 3. Total Load is for normal (100%) duration.
- 4. These tables do not reflect any additional stiffness provided by the floor sheathing.
- 5. Live Load deflection is limited to L/360, L/480 or L/600 as noted in the table.
- Total Load deflection is limited to L/240. Long term deflection (creep) has not
- been considered. 7. These tables assume full lateral support of the compression flange (maximum unbraced
- length of 24").
 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" an intermediate bearing length of at least
- at least 2-1/2" for depths greater than 16," an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\,\perp}$ = 425 psi).

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check both the Total Load and the appropriate Live Load column.
 - To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist
 may be halved to verify the capacity of each ply. The capacity is additive. See Double I-Joist Connection
 detail on page 15.
 - 4. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked "*", then web stiffeners are also required at both end supports.
 - Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
 - 6. Where the Live Load is blank, the Total Load governs the design.
 - 7. Do not use a product where designated "-" without further analysis by a design professional.

Floor Details

Floor Details

I-JOIST HEADER CROSS-SECTION

Filler Blocks:

Fasten I-Joists together with filler blocks between the LPI webs using 2 rows of 0.131"x3.25" nails at 6" o.c. from both sides, stagger rows, and clinch where possible.

Refer to the I-Joist Filler Thickness table for the correct filler block thickness for each LPI series.

Filler blocks must be at least 4' long, located at each support, and centered behind each hanger. For joists supporting only top loads that are equally applied to both plies, filler blocks can be spaced at 8' on center maximum

Backer Blocks:

Fasten min. 12" long backer blocks at all hangers and concentrated loads, center backer block on load, using a minimum of 10 nails (0.131"x3.25", clinch where possible) spaced to avoid splitting with half the nails to each side of the center of the supported hanger.

Refer to the I-Joist Filler Tickness table for the correct backer block thickness for each LPI series. For a single I-joist header, install backer blocks to both sides of the web.

Backer blocks may be omitted for top-mount hangers supporting only downward loads not exceeding 250 lbs. Install backer blocks tight to top flange for top-mount hangers or top concentrated loads unevenly applied to both plies. Install tight to bottom flange for joists supporting face-mount hangers.

> **BEVEL CUT/FIRE CUT** LPI blocking or other lateral support

required at ends of I-Joist

NOTES:

1. For double LPI's the maximum "Side-Applied" unfactored loads for standardard duration: Uniform Load = 520 plf, Concentrated Load = 1200 lbs. Loads may be increased with more nails, and adjusted for other load durations

2. Filler and backer blocks shall consist of APA Rated wood structural panel (OSB or plywood), 2 x lumber (SPF or better) or LP® SolidStart® LVL, LSL or OSB Rim Board.

3. Filler and backer blocks for members that are top-loaded only, or for hangers that do not require nailing into the web, shall be at least 5-1/2" deep for I-joists to 11-7/8" deep, and shall be at least 7-1/4" deep for I-joists 14" and deeper. Otherwise filler blocks shall fit the clear distance between flanges with a gap of at least 1/8", but not more than 1".

Filler Block Example: Lumber fillers may be stacked to achieve the required depth. Two 2 x 8s may be stacked vertically to achieve the filler depth for an 18" deep I-joist (min. req. is 18"-3"-1"=14"). One row of nails must be in each row of stacked fillers.

Backer Block Example: Two pieces of 2 x 8 (min.) lumber, cut to the proper height, may be set vertically side-by-side to achieve the required minimum 12" length.

I-JOIST FILLER THICKNESS

Series	Filler Block	Web Filler/Backer Block	
LPI 36	1-7/8"	7/8"	
LPI 42Plus LPI 52Plus LPI 56	3"	1-1/2"	

NOTES:

Backer blocks and filler blocks shall consist of APA Rated wood structural panel 1. (OSB or plywood), or 2x lumber (SPF or better).

2. LP LVL, LSL or OSB Rim Board may also be used.

3. Refer to the Notes for the I-Joist Header Cross-Section above for details on the required height and length, and nailing of the backer blocks and filler blocks.

1. Some wind or seismic loads may require different or additional details and connections.

2. Verify building code requirements for suitability of details shown.

- 3. Refer to page 5 for bearing length requirements.
- Refer to page 16 for Flange Nailing Schedule for LPI rim joist and blocking panel nailing. 4.
- Lateral support shall be considered for bottom flange when there is no sheathing on underside. 5.

Bevel cut may not extend beyond inside face of

bearing wall

- 6. Verify capacity and fastening requirements of hangers and connectors.
- 7. Squash block capacity designed by others.
- 8. Do not use rim joists with flanges wider than 2-1/2".

Web Stiffeners, Rim & Blocking, Nailing

NOTES:

- Web stiffeners shall be installed in pairs one to each side of the web. Web stiffeners are always required for the "Bird's Mouth" roof joist bearing detail.
- 2. Web stiffeners shall be cut to fit between the flanges of the LP® SolidStart® I-Joist, leaving a minimum 1/8" gap (1" maximum). At bearing locations, the stiffeners shall be installed tight to the bottom flange. At locations of concentrated loads, the stiffeners shall be installed tight to the top flange.
- Web stiffeners shall be cut from APA Rated OSB (or equal) or from LP SolidStart LVL, LSL or OSB Rim Board. 2x lumber is permissible. Do NOT use 1x lumber as it tends to split. Do NOT build up the required stiffener thickness from multiple pieces.
- 4. Web stiffeners shall be the same width as the bearing surface, with a minimum of 3-1/2".
- See Web Stiffener Requirements for minimum stiffener thickness, maximum stiffener height and required nailing.

LPI 42Plus	18"	1700				
	20"	1580				
	24"	1100				
	11-7/8"	2400				
LPI 52Plus	14"	2200				
	16"	2000				
	11-7/8"	2400				
	14"	2200				
LPI 56	16"	1900				
	18"	1700				
	24"	1100				

NOTES:

- 1. Uniform Vertical Load Capacity shall not be adjusted for load duration.
- 2. Concentrated vertical loads require the addition of squash blocks. Do not use LPI rim or blocking to support concentrated vertical loads.
- Lateral load capacity for all series above is 200 plf but may be limited by the connection details used. Do not exceed the Flange Face Nailing requirements at right.

Web Hole Specifications

DESIGN ASSUMPTIONS:

- The hole locations listed above are valid for floor joists supporting only uniform loads. The total uniform load shall not exceed 190 plf (e.g., 50 psf Live Load and 25 psf Dead Load with a 20 psf Partition Load, spaced 24" oc). The uniform Dead Load shall be at least 25 plf. An additional concentrated "safe" load of 2000 lbs. acting over 6.25 ft² (2.5'x2.5') has also been included.
- Hole location is measured from the inside face of bearing to the center of a circular hole, or to the nearest edge of a rectangular hole, from the closest support.
- Clear Span has not been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.
- 4. The maximum hole diameter for circular holes and depth for rectangular holes is the I-joist Depth less 4," except the maximum hole depth is 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18" Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width, and the hole depth is assumed to be the maximum for that joist depth.
- Holes cannot be located in the span where designated "-", without further analysis by a design professional.

NOTES:

7.

- Holes may be placed anywhere within the depth of the joist. A minimum 1/4" clear distance from the flanges is recommended so as not to cut a flange.
- 2. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
- 3. Perforated "knockouts" may be neglected when locating web holes.
- 4. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
- 5. Multiple holes shall have a clear separation along the length of the joist of at least twice the larger dimension of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater.
- 6. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
- For conditions not covered in this table, use LP's design software or contact your local LP® SolidStart® Engineered Wood Products distributor for more information.

Web Hole Specifications: Circular Holes

TO USE:

1. Select the required series and depth.

2. Determine the support condition for the nearest bearing: end support or interior support (including cantilever-end supports).

3. Select the row corresponding to the required clear span. For clear spans between those listed, use the next largest value.

4 Select the column corresponding to the required hole diameter. For diameters between those listed, use the next largest value.

5. The intersection of the Span row and Hole Diameter column gives the minimum distance from the inside face of bearing to the center of a circular hole.

6. Double check the distance to the other support, using the appropriate support condition.

Note: Refer to page 17 for the design assumptions and notes for this table. * Applies to the 24" LPI 56

Web Hole Specifications: Rectangular Holes

TO USE:

1. Select the required series and depth.

2. Determine the support condition for the nearest bearing: end support or interior support (including cantilever-end supports).

3. Select the row corresponding to the required clear span. For clear spans between those listed, use the next largest value.

4. Select the column corresponding to the required hole dimension. For dimensions between those listed, use the next largest value.

5. The intersection of the Span row and Hole Dimension column gives the minimum distance from the inside face of bearing to the nearest edge of a square or rectangular hole.

6. Double check the distance to the other support, using the appropriate support condition.

Roof Span Tables: Low Pitch (6:12 or less) for 20, 25 and 30 psf Load

TO USE:

- 1. Select the appropriate set of tables based on roof pitch.
- 2. Select the section of that table that corresponds to the design roof live load (snow or non-snow).
- 3. Find a span that meets or exceeds the design span for
- the appropriate roof dead load (15 psf or 20 psf). 4. Read the corresponding series, depth and spacing.

DESIGN ASSUMPTIONS:

- 1. The spans listed are the horizontal clear distance between supports and are valid for simple or continuous span applications. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- 2. The spans are based on uniform gravity loads only as listed for each table, including the effects of a 300 lb concentrated load. These spans have not been evaluated for wind.
- 3. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 4. Live load deflection is limited to L/240.
- 5. Total load deflection is limited to L/180.
- 6. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16," an interior bearing length of at least 3-1/2," and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

- 1. Web stiffeners are not required for the Roof Span tables except when using a "bird's mouth" detail for the low-end bearing. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 2. L/240 represents the maximum deflection allowed per code for roof joists supporting non-plaster ceilings. Verify deflection limits with local code requirements.
- 3. Roof joists shall have a minimum pitch of 1/4" per foot (1/4:12) for positive drainage.
- 4. Roof applications in high wind areas require special analysis which may reduce spans and may require bracing of the bottom flange and special connectors to resist uplift.
- For conditions not shown, use the Uniform Roof Load (PLF) tables, LP's 5. design software or contact your LP[®] SolidStart[®] Engineered Wood Products distributor for assistance.

Roof Span Tables: Low Pitch (6:12 or less) for 40, 50 and 60 psf Load

TO USE:

- 1. Select the appropriate set of tables based on roof pitch.
- 2. Select the section of that table that corresponds to the design roof live load (snow or non-snow).
- 3. Find a span that meets or exceeds the design span for
- the appropriate roof dead load (15 psf or 20 psf). 4. Read the corresponding series, depth and spacing.

DESIGN ASSUMPTIONS:

- 1. The spans listed are the horizontal clear distance between supports and are valid for simple or continuous span applications. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- 2. The spans are based on uniform gravity loads only as listed for each table, including the effects of a 300 lb concentrated load. These spans have not been evaluated for wind.
- 3. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 4. Live load deflection is limited to L/240.
- Total load deflection is limited to L/180. 5.
- 6. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16," an interior bearing length of at least 3-1/2," and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

- 1. Web stiffeners are not required for the Roof Span tables except when using a "bird's mouth" detail for the low-end bearing. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 2. L/240 represents the maximum deflection allowed per code for roof joists supporting non-plaster ceilings. Verify deflection limits with local code requirements.
- 3. Roof joists shall have a minimum pitch of 1/4" per foot (1/4:12) for positive drainage.
- 4. Roof applications in high wind areas require special analysis which may reduce spans and may require bracing of the bottom flange and special connectors to resist uplift.
- For conditions not shown, use the Uniform Roof Load (PLF) tables, LP's 5. design software or contact your LP[®] SolidStart[®] Engineered Wood Products distributor for assistance.

* Deflections rounded to the nearest 1/16.

Roof Span Tables: High Pitch (6:12 to 12:12) for 20, 25 and 30 psf Load

TO USE:

- 1. Select the appropriate set of tables based on roof pitch.
- Select the section of that table that corresponds to the design roof live load (snow or non-snow).
- 3. Find a span that meets or exceeds the design span for
- the appropriate roof dead load (15 psf or 20 psf).4. Read the corresponding series, depth and spacing.
- 4. Read the corresponding series, depth and spacing

DESIGN ASSUMPTIONS:

- The spans listed are the horizontal clear distance between supports and are valid for simple or continuous span applications. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The spans are based on uniform gravity loads only as listed for each table, including the effects of a 300 lb concentrated load. These spans have not been evaluated for wind.
- 3. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 4. Live load deflection is limited to L/240.
- 5. Total load deflection is limited to L/180.
- 6. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" an interior bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c_\perp} = 425$ psi).

ADDITIONAL NOTES:

- Web stiffeners are not required for the Roof Span tables except when using a "bird's mouth" detail for the low-end bearing. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- L/240 represents the maximum deflection allowed per code for roof joists supporting non-plaster ceilings. Verify deflection limits with local code requirements.
- 3. Roof joists shall have a minimum pitch of 1/4" per foot (1/4:12) for positive drainage.
- Roof applications in high wind areas require special analysis which may reduce spans and may require bracing of the bottom flange and special connectors to resist uplift.
- For conditions not shown, use the Uniform Roof Load (PLF) tables, LP's design software or contact your LP[®] SolidStart[®] Engineered Wood Products distributor for assistance.

Roof Span Tables: High Pitch (6:12 to 12:12) for 40, 50 and 60 psf Load

TO USE:

- 1. Select the appropriate set of tables based on roof pitch.
- Select the section of that table that corresponds to the design roof live load (snow or non-snow).
- 3. Find a span that meets or exceeds the design span for the appropriate roof dead load (15 psf or 20 psf).
- Read the corresponding series, depth and spacing.

DESIGN ASSUMPTIONS:

- The spans listed are the horizontal clear distance between supports and are valid for simple or continuous span applications. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The spans are based on uniform gravity loads only as listed for each table, including the effects of a 300 lb concentrated load. These spans have not been evaluated for wind.
- 3. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 4. Live load deflection is limited to L/240.
- 5. Total load deflection is limited to L/180.
- 6. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16" an interior bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c_\perp} = 425$ psi).

ADDITIONAL NOTES:

- Web stiffeners are not required for the Roof Span tables except when using a "bird's mouth" detail for the low-end bearing. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- L/240 represents the maximum deflection allowed per code for roof joists supporting non-plaster ceilings. Verify deflection limits with local code requirements.
- 3. Roof joists shall have a minimum pitch of 1/4" per foot (1/4:12) for positive drainage.
- Roof applications in high wind areas require special analysis which may reduce spans and may require bracing of the bottom flange and special connectors to resist uplift.
- For conditions not shown, use the Uniform Roof Load (PLF) tables, LP's design software or contact your LP[®] SolidStart[®] Engineered Wood Products distributor for assistance.

Uniform Roof Load (PLF) Tables: LPI 36 Simple Spans

TO USE:

- 1. Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live 3. Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

2.

An I-Joist has the horizontal clear span of 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit. Sloped Span = (27' + 3-1/2") * 1.054 = 28.86' 1.

- Select the row corresponding to a 29' span.
- Design Total Load = (30 + 15) * (24 / 12) = 90 plf Design Live Load = 30 * (24 / 12) = 60 plf
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: 3. The 16" LPI 36 supports 93 plf Total Load (Snow 115%) and 70 plf Live Load at L/240 NOTE: Web stiffeners required at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports, along the sloped length of the joist, for simple span 1. applications only.
- 2. The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- Total Load is for Snow (115%) or Non-Snow (125%) duration as noted. 3.
- 4. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 5. Total deflection is limited to L/180. Long term deflection (creep) has not been considered.
- Live Load deflection is limited to L/360 or L/240 as noted in the table. 6.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift.
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for 8. depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ROOF PITCH ADJUSTMENT FACTORS

Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414

- The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) 1. of length.
- 2. The designer shall check the appropriate Total Load and the Live Load column.
- 3. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads 4. on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- Web stiffeners are not required where only one value is shown for Total Load or 5. when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design
- 8. To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- 9. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Roof Load (PLF) Tables: LPI 36 Continuous Spans

TO USE:

- Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page.
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live Load column from the Uniform Floor Load Tables on pages 6-13.
- Select a product that exceeds both the design total and live loads.
 Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 20'-8" and 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit.

- 1. Sloped Span = (32 + 3/12) * 1.054 = 33.99' (use the longest span)
- Select the row corresponding to a 34' span. 2. Design Total Load = (30 + 15) * (24 / 12) = 90 plf
- Design Live Load = 30 * (24 / 12) = 60 plf
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: Cannot use the LPI 36 series - exceeds Total Load for all depths at 34' (plate bearing control)

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports, along the sloped length of the joist, for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- 3. Total Load is for Snow (115%) or Non-Snow (125%) duration as noted.
- 4. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 5. Total deflection is limited to L/180. Long term deflection (creep) has not been considered.
- 6. Live Load deflection is limited to L/360 or L/240 as noted in the table.
- These tables assume full lateral support of the compression flange (maximum unbraced length of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift.
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16," an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate (F_{c.1} = 425 psi).

ROOF PITCH ADJUSTMENT FACTORS

Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- $\ensuremath{\mathbf{2}}.$ The designer shall check the appropriate Total Load and the Live Load column.
- For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- 4. To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- 5. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked ***, then web stiffeners are also required at both end supports.
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design.
- To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
 Do not use a product where designated "-" without further analysis by a design professional.
 - y a design professional.

Uniform Roof Load (PLF) Tables: LPI 42Plus Simple Spans

TO USE:

- 1. Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live 3. Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit. Sloped Span = (32 + 3/12) * 1.054 = 33.99' 1.

- Select the row corresponding to a 34' span.
- Design Total Load = (30 + 15) * (24 / 12) = 90 plf Design Live Load = 30 * (24 / 12) = 60 plf 2.
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: 3. The 20" LPI 42Plus supports 95 plf Total Load (Snow 115%) and 88 plf Live Load at L/240

DESIGN ASSUMPTIONS:

Span is the clear distance between supports, along the sloped length of the joist, for simple span 1. applications only.

- 2. The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- Total Load is for Snow (115%) or Non-Snow (125%) duration as noted. 3.
- 4. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 5. Total deflection is limited to L/180. Long term deflection (creep) has not been considered.
- Live Load deflection is limited to L/360 or L/240 as noted in the table. 6.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24").
- Design for wind may require bracing of the bottom flange and special connectors to resist uplift. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for 8. depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ROOF PITCH ADJUSTMENT FACTORS

Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12	
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414	

ADDITIONAL NOTES:

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check the appropriate Total Load and the Live Load column.
- 3. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads 4.
- on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive. Web stiffeners are not required where only one value is shown for Total Load or 5.
- when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design
- 8. To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- 9. Do not use a product where designated "-" without further analysis by a design professional.

DESIGN ASSUMPTIONS:

- Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page.
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live Load column from the Uniform Floor Load Tables on pages 6–13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 20'-8" and 32'-3," supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit.

- 1. Sloped Span = (32 + 3/12) * 1.054 = 33.99' (use the longest span)
- Select the row corresponding to a 34' span. 2. Design Total Load = (30 + 15) * (24 / 12) = 90 plf
- Design Total Load = (30 + 15) * (24 / 12) = 90 p
 Design Live Load = 30 * (24 / 12) = 60 plf
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240:
 <u>The 20" LPI 42Plus supports 92 plf Total Load (Snow 115%). Live Load does not control.</u>

Span is the clear distance between supports, along the sloped length of the joist, for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.

- The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- 2. The designer shall check the appropriate Total Load and the Live Load column.
- For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-loist, the values in these tables can be doubled, or the design loads on the I-loist may be halved to verify the capacity of each ply. The capacity is additive.
- 5. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked ***, then web stiffeners are also required at both end supports.
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design
- 8. To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- 9. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Roof Load (PLF) Tables: LPI 52Plus Simple Spans

TO USE:

- 1. Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the 3. appropriate Live Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 32'-3", supporting 20 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit. Sloped Span = (32 + 3/12) * 1.054 = 33.99' 1.

- Select the row corresponding to a 34' span.
- 2. Design Total Load = (20 + 15) * (24 / 12) = 70 plf Design Live Load = 20 * (24 / 12) = 40 plf
- 3. Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: The 16" LPI 52Plus supports 83 plf Total Load (Snow 115%) and 62 plf Live Load at L/240

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports, along the sloped length of the joist, for simple span 1. applications only.
- The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- Total Load is for Snow (115%) or Non-Snow (125%) duration as noted. 3.
- 4. These tables do not reflect any additional stiffness provided by the roof sheathing.
- Total deflection is limited to L/180. Long term deflection (creep) has not been considered. 5.
- Live Load deflection is limited to L/360 or L/240 as noted in the table. 6.
- These tables assume full lateral support of the compression flange (maximum unbraced length 7.
- of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift.
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp} = 425$ psi). 8.

ADDITIONAL NOTES:

- The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of 1. length.
- 2 The designer shall check the appropriate Total Load and the Live Load column.
- For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page. 3.
- To design a double I-loist, the values in these tables can be doubled, or the design 4 loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- 5. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners).
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web
- 7 Where the Live Load is blank, the Total Load governs the design.
- To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load 8. tables.
- 9. Do not use a product where designated "-" without further analysis by a design professional

ROOF PITCH ADJUSTMENT FACTORS

				1170	10110							
Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12	
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414	

Uniform Roof Load (PLF) Tables: LPI 52Plus Continuous Spans

TO USE:

- Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page.
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 20'-8" and 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit.

- 1. Sloped Span = (32 + 3/12) * 1.054 = 33.99' (use the longest span)
- Select the row corresponding to a 34' span. 2. Design Total Load = (30 + 15) * (24 / 12) = 90 plf
- Design Total Load = (30 + 15) * (24 / 12) = 90 p Design Live Load = 30 * (24 / 12) = 60 plf
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: The 16" LPI 52Plus supports 92 plf Total Load (Snow 115%) and 81 plf Live Load at L/240

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports, along the sloped length of the joist, for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less than 50% of the longest span.
- The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- Total Load is for Snow (115%) or Non-Snow (125%) duration as noted.
- These tables do not reflect any additional stiffness provided by the roof sheathing.
- Total deflection is limited to L/180. Long term deflection (creep) has not been considered.
- Live Load deflection is limited to L/360 or L/240 as noted in the table.
- These tables assume full lateral support of the compression flange (maximum unbraced length of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift.
- 8. The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for depths greater than 16", an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length.
- The designer shall check the appropriate Total Load and the Live Load column.
 For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- 5. Web stiffeners are not required where only one value is shown for Total Load or when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked ***, then web stiffeners are also required at both end supports.
- 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design.
- 8. To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- Do not use a product where designated "-" without further analysis by a design professional.

ROOF PITCH ADJUSTMENT FACTORS

ROOF P	IICH /	40103		IT FAU	IUNS							
Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12	
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414	

Uniform Roof Load (PLF) Tables: LPI 56 Simple Spans

TO USE:

- 1. Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the 3. appropriate Live Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

An I-Joist has the horizontal clear span of 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit. Sloped Span = (32 + 3/12) * 1.054 = 33.99' 1.

- Select the row corresponding to a 34' span.
- Design Total Load = (30 + 15) * (24 / 12) = 90 plf Design Live Load = 30 * (24 / 12) = 60 plf 2.
- Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: 3. The 16" LPI 56 supports 90 plf Total Load (Snow 115%) and 67 plf Live Load at L/240 NOTE: Web stiffeners required at both end supports

Span			11-7/8" LPI	56			14" LPI 56	3			16" LPI 56	3	Span

DESIGN ASSUMPTIONS:

Span is the clear distance between supports, along the sloped length of the joist, for simple span 1. applications only.

- 2. The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for roof pitch. Wind uplift has not been considered.
- 3. Total Load is for Snow (115%) or Non-Snow (125%) duration as noted.
- 4. These tables do not reflect any additional stiffness provided by the roof sheathing.
- 5. Total deflection is limited to L/180. Long term deflection (creep) has not been considered.
- Live Load deflection is limited to L/360 or L/240 as noted in the table. 6.
- 7. These tables assume full lateral support of the compression flange (maximum unbraced length of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift.
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" for 8. depths greater than 16", and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ROOF PITCH ADJUSTMENT FACTORS

Roof Pitch	2:12	3:12	4:12	5:12	6:12	7:12	8:12	9:12	10:12	11:12	12:12
Factor	1.014	1.031	1.054	1.083	1.118	1.158	1.202	1.250	1.302	1.357	1.414

- The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) 1. of length.
- 2. The designer shall check the appropriate Total Load and the Live Load column.
- 3. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads 4. on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- Web stiffeners are not required where only one value is shown for Total Load or 5. when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at both end supports if the design total load exceeds the first value. Do not exceed the second value
- (capacity with stiffeners). 6. Web fillers are required for I-Joists seated in hangers that do not laterally support the top flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design
- 8. To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- 9. Do not use a product where designated "-" without further analysis by a design professional.

Uniform Roof Load (PLF) Tables: LPI 56 Continuous Spans

TO USE:

- 1. Select the span required. For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by the appropriate roof pitch adjustment factor from the table at the bottom of this page
- Compare the design total load to the appropriate Total Load column for Snow (115%) or Non-Snow (125%). Where two numbers are shown, the first number represents the Total Load capacity without web stiffeners. The second number represents the Total Load capacity with stiffeners. (See Additional Notes below.)
- Compare the design live load to the appropriate Live Load column (L/360 or L/240). For live load deflection limits of L/600 or L/480, compare the design live load to the appropriate Live 3. Load column from the Uniform Floor Load Tables on pages 6-13.
- 4. Select a product that exceeds both the design total and live loads.
- 5. Specify web stiffeners as dictated by the Total Load column.

EXAMPLE:

- An I-Joist has the horizontal clear span of 20'-8" and 32'-3", supporting 30 psf Snow Load (115%) and 15 psf Dead Load, spaced 24" oc, with a slope of 4:12. Select a joist that satisfies an L/240 live load deflection limit.
- Sloped Span = (32 + 3/12) * 1.054 = 33.99' (use the longest span) 1.
- Select the row corresponding to a 34' span Design Total Load = (30 + 15) * (24 / 12) = 90 plf 2
- Design Live Load = 30 * (24 / 12) = 60 plf
- 3 Select the first I-Joist to exceed both Total Load for Snow (115%) and L/240: The 16" LPI 56 supports 111 plf Total Load (Snow 115%) and 88 plf Live Load at L/240 NOTE: Web stiffeners required at the intermediate support and at both end supports.

DESIGN ASSUMPTIONS:

- Span is the clear distance between supports, along the sloped length of the joist, for continuous span applications only. Continuous spans are based on the longest span. The shortest span shall not be less 1. than 50% of the longest span.
- The values in the tables are for uniform loads only and represent the design gravity loads, unadjusted for 2. roof pitch. Wind uplift has not been considered
- 3 Total Load is for Snow (115%) or Non-Snow (125%) duration as noted.
- These tables do not reflect any additional stiffness provided by the roof sheathing. 4.
- Total deflection is limited to L/180. Long term deflection (creep) has not been considered. 5.
- 6. Live Load deflection is limited to L/360 or L/240 as noted in the table.
- These tables assume full lateral support of the compression flange (maximum unbraced length of 24"). Design for wind may require bracing of the bottom flange and special connectors to resist uplift. 7.
- The spans are based on an end bearing length of at least 1-3/4" for depths up to 16" and at least 2-1/2" 8. for depths greater than 16," an intermediate bearing length of at least 3-1/2" and are limited to the bearing capacity for an SPF wall plate ($F_{c\perp}$ = 425 psi).

ADDITIONAL NOTES:

- 1. The allowable loads represent the capacity of the joist in pounds per lineal foot (plf) of length
- 2. The designer shall check the appropriate Total Load and the Live Load column.
- For roofs with a pitch of 2:12 or greater, the horizontal span shall be multiplied by 3. the appropriate adjustment factor from the table at the bottom of this page.
- To design a double I-Joist, the values in these tables can be doubled, or the design loads 4 on the I-Joist may be halved to verify the capacity of each ply. The capacity is additive.
- Web stiffeners are not required where only one value is shown for Total Load or 5. when the design total load does not exceed the first value (capacity without stiffeners) in the Total Load column where two values are given. Web stiffeners are required at interior supports if the design total load exceeds the first value. Do not exceed the second value (capacity with stiffeners). If the capacity with stiffeners is marked "*", then web stiffeners are also required at both our exceed the second value (capacity with stiffeners) is marked "*". at both end supports.
- Web fillers are required for I-Joists seated in hangers that do not laterally support the top 6 flange or for hangers that require nailing into the web.
- 7. Where the Live Load is blank, the Total Load governs the design. 8
- To design for a live load deflection limit of L/600 or L/480, use the Uniform Floor Load tables.
- without further analysis by a design professional.

Roof Pitch 2:12 3:12 4:12 5:12

Factor

Roof Details

NOTES:

- Minimum pitch: 1/4" per foot (1/4:12). Maximum pitch: 12" per foot (12:12).
- 2. Verify capacity and fastening requirements of hangers and connectors.
- Some wind or seismic loads may require different or additional details and connections. Uplift anchors may be required.
- 4. 4" diameter hole(s) may be cut in blocking for ventilation.
 5. Lateral resistance shall be provided. Other methods of restraint. such as full deoth LP SolidStart OSB Rim Board.
 - restraint, such as full depth LP SolidStart OSB Rim Board, LP® SolidStart® LVL, LP SolidStart LSL or metal X-bracing may be substituted for the LP blocking shown.

Sprinkler Details

- 7. Spacing between joists is limited to 48" oc.
- 8. Framing members to be SPF or better.

- 5. Spacing between joists is limited to 48" oc.
- 6. Framing members to be SPF or better.

6. Framing members to be SPF or better.

- Consult NFPA 13 for maximum supported pipe diameter. 4.
- 5. See product specific technical guide for hole sizes and location.
- 6. Framing members to be SPF or better.

- Δ
- Consult NFPA 13 for maximum supported pipe diameter.
- 5. Side beam bracket per NFPA 13.
- 6. Framing members to be SPF or better.

LP[®] SolidStart[®] Rim Board

RIM BOARD CAPACITIES

				Lateral ^{4,5,6}		
Material	Grade	Thickness		orm² If)	Concentrated ³ (lbs)	Lateral sad Load Capacity (plf)
			d ≤ 16"	16" < d ≤ 24"	d ≤ 24"	
LP OSB	APA C2/Rim Board ⁷	1"	3300	1650	3500	180
LF USD	APA C1/Rim Board ⁷	1-1/8"	4400	3000	3500	180
LP LSL	1.35E	1-1/4"	6000	3800	3800	250
LF LOL		1-1/2"	7000	4500	4500	280

NOTES:

1. The Vertical Load Capacity shall not be increased for short-term load duration.

2. Uniform Vertical Load Capacity is based on the capacity of the rim board and may need to be reduced based on the bearing capacity of the supporting wall plate or the attached floor sheathing. Example: The allowable bearing stress for commodity floor sheathing is 360 psi so the bearing capacity of a 1-1/4" x 16" deep rim board would be limited to 5400 plf (360 psi x 1-1/4" x 12).

3. The Concentrated Vertical Load capacity is assumed to be applied through a minimum 4-1/2" bearing length (3-stud post).

4. The Lateral Load Capacity is based on a short-term load duration and shall not be increased.

5. The Lateral Load Capacity is based on the connections specified in the Installation details below.

- 6. Additional framing connectors fastened to the face of the rim board may be used to increase lateral capacity for wind and seismic design.
- 7. The APA C1 and C2 grades in product standard ANSI/APA PRR 410-2011 are equivalent to the rim board grade in product standard APA PRR-401.

ALLOWABLE UNIFORM LOADS (PLF) FOR RIM BOARD HEADERS: MAXIMUM 4' CLEAR SPAN

Material	Thislanse	Rim Board Depth						
Material	Thickness	9-1/2"	11-7/8"	2-Ply 14"	2-Ply 16"			
10.000	1"	330 (1-1/2")	480 (3")	1280 (3")	1670 (4-1/2")			
LP OSB	1-1/8"	370 (1-1/2")	540 (3")	1440 (3")	1880 (4-1/2")			
	1-1/4"	655 (1-1/2")	1240 (3")	3540 (4-1/2")	4485 (6")			
LP LSL	1-1/2"	785 (1-1/2")	1490 (3")	4180 (4-1/2")	4645 (6")			

NOTES:

1. This table is for preliminary design for uniform gravity loads only. Final design should include a complete analysis of all loads and connections.

2. The allowable loads are for a maximum 4' clear span with minimum bearings for each end (listed in parentheses) based on the bearing capacity of the rim board. For headers bearing on wood plates, the bearing length may need to be increased based on the ratio of the bearing capacity of the rim board divided by the bearing capacity of the plate species.

3. Normal load duration is assumed and shall be adjusted according to code.

4. Depths greater than 11-7/8" shall be used with a minimum of two plies, as shown. Depths of 11-7/8" and less may be used as a two-ply header by multiplying the allowable loads by two.

5. Multiple-ply headers shall be toe-nailed to the plate from both faces. Fasten the floor sheathing to the top of each ply to provide proper lateral support for each ply.

For multiple-ply headers supporting top-loads only, fasten plies together with minimum 8d box nails (2-1/2" x 0.113") at a maximum spacing of 12" oc. Use 2 rows of nails for 9-1/2" and 11-7/8." 6. Use 3 rows for depths 14" and greater. Clinch the nails where possible. For side-loaded multiple-ply headers, refer to the Connection Capacity For Side-Loaded 2-Ply Rim Board Headers table below for the required nailing and the allowable side load that can be applied.

7. The designer shall verify proper bearing for the header.

8. Joints in the rim are not allowed over openings and must be located at least 12" from any opening.

9. Refer to the "APA Performance Rated Rim Boards" (Form No. W345) for additional information including allowable loads for smaller openings.

10. Use LP[®] SolidStart[®] LSL or LVL for headers with clear spans longer than 4' or for loads greater than tabulated above. Refer to the appropriate technical guide for LP LSL and LVL design values.

CONNECTION CAPACITY FOR SIDE-LOADED 2-PLY RIM BOARD HEADERS (PLF)

•••••••••							
Material	Thickness	Minimum Nail Size	3 Rows of Nails at 6" oc	4 Rows of Nails at 6" oc	5 Rows of Nails at 6" oc	6 Rows of Nails at 6" oc	
LP OSB	1" & 1-1/8"	8d (2-1/2" x 0.113")	768	1024	1280	1536	
LP LSL	1-1/4"	8d (2-1/2" x 0.113")	864	1152	1440	1728	
LP LSL	1-1/2"	10d (3" x 0.120")	972	1296	1620	1944	

NOTES:

This table represents the uniform side-load capacity of the connection for a 2-ply header. The total applied uniform load, including top-load and side-load, 1.

shall not exceed the allowable uniform load capacity of the header as tabulated above.

2. The tabulated side-load capacity is for normal load duration and shall be adjusted according to code.

3. Use 3 rows of nails for 9-1/2" and 11-7/8"; 4 rows for 14" and 16"; 5 rows for 18" and 20"; 6 rows for 22" and 24" deep rim board. Clinch the nails where possible.

4. Headers consisting of more than 2 plies, alternate fastening or higher side loads are possible but require proper design of the connection.

NOTE:

- Additional framing connectors to the face of the rim board may 1. be used to increase lateral capacity for wind and seismic design.
- Trim the tongue or groove of the floor sheathing in accordance with the T&G Trim Requirements table.

T&G TRIM REC	UIREMENTS					
Floor Sheathing	Rim Board Thickness					
Thickness	1"	1" 1-1/8" 1-1/4"		> 1-1/4"		
≤ 7/8"	Trim	Not Required	Not Required	Not Required		
> 7/8"	Trim	Trim	Trim	Not Required		

Warnings

WARNINGS

The following conditions are **NOT** permitted!

Do not use visually damaged products without first checking with your local LP SolidStart Engineered Wood Products distributor or sales office.

HANDLING & STORAGE GUIDELINES

- WARNING: Failure to follow proper procedures for handling, storage and installation could result in unsatisfactory performance, unsafe structures and possible collapse.
- Keep LP® SolidStart® Engineered Wood Products dry. These products are intended to resist the effects of moisture on structural performance from normal construction delays but are not intended for permanent exposure to the weather.
- Unload products carefully, by lifting. Support the bundles to reduce excessive bowing. Individual products should be handled in a manner which prevents physical damage during measuring, cutting, erection, etc. I-Joists shall be handled vertically and not flatwise.
- Keep products stored in wrapped and strapped bundles, stacked no more than 10' high. Support and separate bundles with 2 x 4 (or larger) stickers spaced no more than 10' apart. Keep stickers in line vertically.
- Product must not be stored in contact with the ground, or have prolonged exposure to the weather.
- Use forklifts and cranes carefully to avoid damaging product.
- Do not use a visually damaged product. Call your local LP SolidStart Engineered Wood Products distributor for assistance when damaged products are encountered.
- For satisfactory performance, LP SolidStart Engineered Wood Products must be used under dry, covered and well-ventilated interior conditions in which the equivalent moisture content in lumber will not exceed 16%.
- For built-up members, LP SolidStart I-Joists, LSL and LVL shall be dry before nailing or bolting to avoid trapping moisture.
- LP SolidStart I-Joists, LSL and LVL shall not be used for unintended purposes such as ramps and planks.
