WIDTH: 3 5/8"

INSTALLATION:

- Centered within the load or reaction bearing width.
- Installed on the inside or outside of the joist.
- Web stiffeners require full bearing along their supported ends.
- (4-6) #10 -16 screws are required to attach the stiffener to the joist web using pre-punched holes.

GENERAL NOTES FOR ALL TABLES

1. The information contained in this catalog is intended as a general guide only and all designs shall be verified by a design professional having experience with cold-formed steel design.
2. The data contained in this catalog is based on allowable strength design (ASD) of the 2012 Edition of the North American Specification for the Design of Cold-Formed Steel Structural Members, AISI S100-12 (S100).
3. The strength increase based on cold work of forming has been incorporated for flexural strength per Section A7.2 of S100.
4. Distortional buckling calculations are based on $K_{\phi} = 0$.
5. The effective moment of inertia for deflection is calculated at a stress that results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. Procedure I of S100 was used for serviceability determination.
6. Various sections may be manufactured with yield stresses of 33 or 50 ksi. The yield stress used for calculations is indicated in the tables.
7. For sections available in both 33 and 50 ksi, the specifier must clearly indicate which yield stress is required. *For example: 362S162-54 (50 ksi).*
8. Sections used as nonstructural members that exceed the 10 psf load limit require an approved G60 minimum coating.
9. When provided, factory punchouts shall:
 - be spaced along the centerline of the web of the framing member.
 - have a center-to-center spacing of not less than 24" (610 mm).
 - have a width not greater than half the member depth or 2-1/2" (63.5 mm), whichever is less.
 - have a length not exceeding 4-1/2" (114 mm).
 - The distance from the center of the last punchout to the end of the member shall not be less than 12" (305 mm), unless otherwise specified.

Any configuration or combination of holes that fits within the punchout width and length limitations shall be permitted. Any configuration or combination of holes that fit within the punchout width and length limitations stated above shall be permitted; other punchout configurations and locations not in compliance with the stated limitations must be approved by a design professional.

* This is a NS type steel with no requirement for ultimate.

NOTES:

1. Capacities are based on section E4 of the AISI S100-07 Specification.
2. Capacities are based on Allowable Strength Design (ASD).
3. Screw pull-out capacities are based on listed head diameter.
4. Two sheets of equal thickness and tensile strength are assumed in tabulated values.
5. When materials of different steel thickness and tensile strength are connected, use the lowest value for shear capacity (tilting and bearing), for pull-out capacity use sheet closest to screw tip and for pull-over capacity use sheet closest to screw head.
6. Where multiple fasteners are used, screws are assumed to have a center-to-center spacing of at least 3 times the nominal diameter.

7. Screws are assumed to have a center-of-screw to edge-of-steel dimension of at least 1.5 times the nominal diameter of the screw.
8. When screws are subjected to combination of shear and tension forces, interaction equation of AISI S100-2007 Specification section E4.5 shall be used.
9. Screw Shear (P_{ss}), tension (P_{ts}), diameter, and head diameter are from CFSEI Tech Note (F701-12).
10. Screw shear strength is the average value, and tension strength is the lowest value listed in CFSEI Tech Note (F701-12).
11. Higher values for screw strength (P_{ss}, P_{ts}), may be obtained by specifying screws from a specific manufacturer.

NOTES:

1. Capacities based on the AISI S100 Specification Sections E2.4 for fillet welds and E2.5 for flare groove welds.
2. When connecting materials of different steel thicknesses or tensile strengths, use the lowest values.
3. Capacities are based on Allowable Strength Design (ASD).
4. Weld capacities are based on E60 electrodes. For material thinner than 68 mil, 0.030" to 0.035" diameter wire electrodes may provide best results.
5. Longitudinal capacity is considered to be loading in the direction of the length of the weld.
6. Transverse capacity is loading in perpendicular direction of the length of the weld.
7. For flare groove welds, the effective throat of weld is conservatively assumed to be less than 2t.
8. For longitudinal fillet welds, a minimum value of EQ E2.4.1, E2.4.2, and E2.4.4 was used.
9. For transverse fillet welds, a minimum value of EQ E2.4.3 and E2.4.4 was used.
10. For longitudinal flare groove welds, a minimum value of EQ E2.5.2 and E2.5.3 was used.

CURTAINWALL LIMITING HEIGHTS - SINGLE SPAN

NOTES:

- 1. Listed wind pressures represent the calculated design wind pressure (1.0W based on 2009 IBC or 0.6W based on 2012 IBC). For deflection calculations, the listed wind pressures have been multiplied by 0.70 as per IBC. The 5 psf pressure has not been reduced for deflection calculations.
2. Studs must be braced against rotation and lateral displacement at all supports.
3. Studs are assumed to be adequately braced at a maximum spacing of Lu to develop the full allowable moment, Ma.
4. Web crippling check is based on 1" of bearing at end supports and 3" of bearing at interior support.
5. Shear and web crippling capacity at end supports have NOT been reduced for punchouts. At interior support, the shear and web crippling capacity has been reduced for the presence of punchout adjacent to the support.
6. Combined bending and shear check at interior support is based on unreinforced web as per AISI S100 (Eq.C3.3.1-1). The shear and combined bending and shear check at interior support have been reduced for the presence of punchouts adjacent to the support.
7. Listed "Double Span" limiting heights are based on the distance from either end to the center of the interior support, with the stud continuous past the interior support.
8. "e" - web stiffeners required at ends.
9. See General Notes on Page 6.

Table with columns: MEMBER, Fy, SPACING, and load categories (5 psf, 15 psf, 20 psf, 25 psf, 30 psf, 35 psf, 40 psf, 50 psf) with sub-columns for various dimensions (L/120, L/140, L/360, L/240, L/360, L/600, L/240, L/360, L/600, L/240, L/360, L/600, L/240, L/360, L/600, L/240, L/360, L/600, L/240, L/360, L/600, L/240, L/360, L/600). DIAGONAL CROSS-BRACING

DIAGONAL RACKING BRACING

Diagonal bracing and connections must be designed for the specific conditions of a building. For allowable load capacities of Marino\WARE members and assistance in developing connections, please contact Marino\WARE's Technical Services Department. Buildings must be properly braced to resist racking under wind and seismic loads. In steel-framed construction, diagonal strap bracing offers an economical and effective means to provide this resistance. Straps are sloped to resist racking forces in tension. They are installed over framing members and easily covered with facing materials. Diagonal strap ends are secured by screws or welded to transfer the tension loads to the wall framing and floor assembly. End connections must be designed to transfer accumulated design loads. At the foundation, floor anchors must be adequate to prevent uplift and horizontal shear. Splicing of strapping is not recommended.

DIAGONAL CROSS-BRACING

For selection of Flat Strap (FS) subjected to tension loads in shear wall assemblies or miscellaneous applications.

USE:

Select a flat strap which provides an allowable tensile capacity equal to or greater than the applied tension load.

CROSS BRACING: ALLOWABLE TENSION CAPACITY BASED ON SINGLE STRAP

Flat Strap Bracing (thickness)	Area (in ²)	P _a Without 1/3 increase
2" x 20ga (33mil)	0.0692	1.37

2" x 16ga (54 mil)	0.1132	3.39
4" x 16ga (54 mil)	0.2264	6.79

NOTES:

1. Strap end connections shall be designed to transfer the tensile load.
2. 16 and 14 gauge strap: F_y (min)= 50 ksi
20 and 18 gauge strap: F_y (min)= 33 ksi

COMBINED AXIAL AND LATERAL LOADS

NOTES:

1. Allowable axial loads listed are based on simple one span condition and are given in kips (1 kip = 1,000 lb).
2. Allowable axial loads are determined based on Section C5 of AISI S100 with the assumption that the axial load passes through the centroid of the effective section.
3. Allowable axial loads based on 4'-0" on center bracing.
4. Studs are assumed to be adequately braced at a maximum spacing of L_u to develop the full allowable moment, M_a .
5. Listed wind pressures represent the calculated design wind pressure (1.0W based on 2009 IBC or 0.6W based on 2012 IBC). For deflection calculations, the listed wind pressures have been reduced by 0.70 as per IBC. The 5 psf pressure has not been reduced for deflection checks.
6. End supports have not been checked for web crippling.
7. If no note, deflection meets L/720
8. ¹Deflection meets L/120
9. ²Deflection meets L/240
10. ³Deflection meets L/360
11. ⁴Deflection meets L/600
12. See General Notes on Page 6.

FLOOR & ROOF APPLICATIONS

SOLID BLOCKING (JB)

Joist Blocking is pre-cut to fit securely between joists to prevent joist rotation. Joist Blocking is a one piece system in lieu of the typical 3 piece detail offering an economical alternative to installing conventional clips and solid web members.

MATERIAL: 16 ga (54 mil) 50ksi
FINISH: Galvanized -G90

FLAT STRAP & BLOCKING (D1 & D2)

Blocking

- Locate at first and second spaces at ea. end and 10'-0" o.c.
- Use Matching Piece of o.c. Joist or min. 18 Ga. Track

NOTES:

- Spans are based on continuous support of the compression flange over the full length of the joist and the tension flange is laterally braced at maximum spacing of 8'-0".
- For two equal spans, the listed span is the distance from either end to the center support, with the joist continuous over the center support.
- Joists must be braced against rotation at all supports.
- End shear and web crippling capacity have not been reduced for punchouts.
- End web crippling check is based on a 3.5" bearing length.
Where allowable spans are followed by "e", web stiffeners are required at end supports.
- Interior support not checked for combined bending and web crippling. Web stiffeners are required at interior supports.
- Shear capacity at interior support has been reduced for the presence of punchouts adjacent to the supports.
Combined bending and shear check is based on unreinforced web based on AISI S100 (C3.3.1).
- Total load deflection is limited to L/240. Live load deflection limit is as noted.
- Alternate span live loading has been considered for two equal span conditions.
- Bearing stiffeners must be designed in accordance with AISI S100 section C3.7.
- See General Notes on Page 6.

BRIDGING RECOMMENDATIONS:

Bracing components shall be designed based on AISI S100 (D3) and the minimum number of rows required as shown in table. Additional bridging rows may be required by design. Check fire-rated assemblies for additional requirements.

SPAN (ft)	MINIMUM NUMBER OF ROWS
Up To 16 ft	1 at Mid-span
16 ft To 24 ft	2 Rows at 1/3 Points
24 ft To 32 ft	3 Rows at 1/4 Points

HEADER ALLOWABLE UNIFORM LOADS (lb/ft)

NOTES

1. Values are for unpunched members.
2. Total load deflection is limited to L/360.
3. Headers are made from two "boxed" or back to back members.
4. Allowable moment, shear, web crippling and moment of inertia are based on twice the capacity of a single member.
5. Web crippling check is based on 1" of bearing at end supports.
6. Members are assumed to be adequately braced for bending.
7. Allowable loads are for simply supported headers with uniform bending loads only.
8. "e" web stiffeners required at ends.
9. See General Notes on Page 6.

WEB CRIPPLING LOAD TABLES

NOTES

1. Listed allowable loads apply only to C-sections.
2. For back-to-back members, the listed allowable loads are for the entire two-member assembly.
3. Listed allowable loads are based on members "fastened to supports", except back-to-back members under two-flange loading (Cases 3 and 4) for which data for "fastened to support" is unavailable in AISI S100.
4. For back-to-back members, the distance between the web connectors and the flange shall be kept to a minimum.
5. Listed allowable loads are for non-punched webs. Capacity reductions for end and interior one flange loading (Cases 1 and 2) near punchouts can be calculated based on AISI S100 (C3.4.2).
6. "h" refers to the flat dimension of the web. See web depth-to-thickness ratios table herein.
7. + If $N/h > 2$, then N was set equal to 2h.
8. * If $N/t > 210$, then N was set equal to 210(t)
9. See General Notes on Page 6.

CEILING SPANS (C-SECTIONS)

NOTES

1. Values are for simple span conditions.
2. For unbraced sections, the allowable moment is based on AISI S100 (C3.1.2) with the unbraced length assumed to be the listed span. For mid-span braced members, the allowable moment is based on AISI S100 (C3.1.2) with the unbraced length to be half the listed span.
3. Web crippling calculation is based on a bearing length of 1".
4. Web crippling and shear capacity have NOT been reduced for punchouts. If web punchouts occur near supports, members must be checked for reduced shear and web crippling based on AISI S100.
5. "e" indicates that web stiffeners are required at ends.
6. * 13 psf requires a G60 minimum coating.
7. See General Notes on Page 6.

SECTION PROPERTIES AND CEILING SPANS (U-SECTIONS)

ALLOWABLE CEILING SPAN (U-SECTIONS) NOTES

- Multiple span indicates two or more equal spans continuous over interior supports.
- Compression flanges assumed unbraced.
- Web crippling based on 3/4" bearing at end and interior supports.
- When applicable, cold work of forming was considered as per Section A7.2 of AISI S100-07.
