

## **COPPER TUBE FOR HVACR APPLICATIONS**

Job Name	Contractor
Job Location	Wholesaler
Engineer	Streamline <sup>®</sup> Rep

### **Product Description:**

Streamline<sup>®</sup> Service Coils, ACR/Nitrogenized straight-length or line set copper tube for use in refrigeration applications. Available sizes ranging from 1/8" to 8-1/8" in outside diameter. All tube should be manufactured in the United States.

#### Material:

Streamline<sup>®</sup> Copper Tube is manufactured from UNS CI 2200 grade of copper.

### **Key Specifications:**

Streamline<sup>®</sup> Copper Refrigeration Service Coils, ACR/Nitrogenized straight lengths and line sets are made to meet the chemical, mechanical, cleanness, and eddy current testing requirements of the applicable specification of ASTM B280. Streamline<sup>®</sup> copper tube is third party verified in select sizes<sup>1</sup> through Underwriters Laboratories (UL) for operating pressure of 700psi at 250°F.

### Installation:

Installations shall comply with the latest applicable building codes for the local jurisdiction. For detailed installation instructions, consult the Copper Development Association at copper.org.

A BRAND OF MUELLER INDUSTRIES

## **COPPER TUBE DATA**

Mueller Streamline's cleaning, purging and pressurizing process assures the high level of tube cleanliness in conformance to ASTM B280, the refrigeration industry standard. The tube is sealed with plugs which maintain the standard of cleanliness from the factory to the job site.

**STREAMLINE® COPPER TUBE PRESSURIZED WITH NITROGEN** provides maximum protection against the formation of harmful oxides normally formed during brazing operations. Reduction of these oxides greatly reduces system contamination. Plugs are reusable. When less than a 20' length of tube is required for an installation the unused length of tube may be re-plugged to prevent atmospheric contamination during storage.

**STREAMLINE® NITROGENIZED** seamless copper tube is available in sizes 3/8" OD through 3-1/8" OD. Larger sizes from 3-5/8" OD through 8-1/8" OD are cleaned and capped. Manufactured and cleaned in accordance with ASTM B280. 20-ft. lengths hard drawn - cleaned and capped - color coded - Marked "ACR/MED"

# **COPPER TUBE DATA**

### **REFRIGERATION SERVICE TUBE**

**STREAMLINE**<sup>®</sup> dehydrated and nitrogen purged and sealed copper tube is of a consistent annealed temper, bright and thoroughly dried and packaged in individual cartons. Each carton is clearly labeled showing size and length.

Tube is manufactured in accordance with ASTM B280 and ANSI B9.1, refrigeration industry standards. For special lengths and sizes not listed please consult your local Mueller Streamline representative.

### **TECHNICAL DATA**

† UL Recognized to 700 PSI (select sizes)

All ratings listed for types K, L, M, DWV and refrigeration service tube in the preceding charts are calculated for tube in the annealed condition. These values should be used when soldering, brazing or welding is employed for joining components in a system. While the ratings for hard drawn tube are substantially higher, they should only be used for systems using properly designed flare or compression mechanical joints, since joining by any heating process might anneal (soften) the tube.

In designing a system, careful consideration should also be given to joint ratings as well as those of the components.

We believe HVACR connections should be made by brazing (using filler metals that melt above 800°F), which is primarily because solder alloys may not be suitable to high vibration and aggressive thermal-cycling environments.

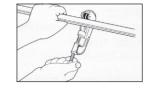

Streamline<sup>®</sup> copper tube meets many HVACR codes including, but not limited to: ASME B31.5 ASHRAE 15

## **COPPER TUBE AND SOLDER/BRAZE TYPE FITTINGS**

- 1. Cut tube square with the cutter and remove burrs
- 2. Clean outside end of copper tube thoroughly with sand cloth or sandpaper equal depth of fitting. Leave no dark spots.
- 3. Clean inside of fitting carefully to tube stop with wire brush. Note: Sand cloth or sandpaper may also be used.
- **4.** Using a brush, apply light uniform coat of flux to the outside of the tube and inside of the fitting.
- 5. Slip tube into fitting to tube stop. Turn tube back and forth once or twice to distribute flux evenly.
- 6. Apply heat uniformly around the fitting with torch. When filler metal melts upon contact with heated fitting, the proper soldering temperature has been reached. Remove flame and feed filler metal slightly off center at the bottom of the joint. Proceed across the bottom of the fitting and up to the top center position. Return to the starting point, and then proceed up the incomplete side to the top, again, overlapping the filler metal. Wipe off surplus solder with a piece of cloth.

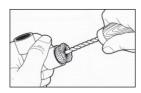

**CAUTION:** Do not overheat the joint or direct the flame into the face of the fitting cup. Overheating could burn the flux, which will destroy its effectiveness and the solder will not enter the joint properly.

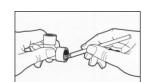

• Cut tube to length & remove burrs.

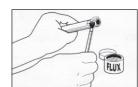

2. Clean outside of tube with sandpaper or sand cloth.

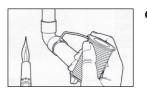

3. Clean inside of fitting with wire brush, sand cloth or sandpaper.

**4.** Apply flux thoroughly to inside of fitting.

 Apply flux thoroughly to outside of tube - assemble tube and fitting.

6. Apply heat with torch. When filler metal melts upon contact with heated fitting, the proper temp for soldering has been reached. Remove flame & feed filler metal to the joint at one or two points until a ring of solder appears at the end of the fitting.
