

LEED® v4.1 CREDITS GUIDE

HELPING YOU ACHIEVE LEED® CERTIFICATION

LEED® promotes the use of durable, affordable, and sustainable materials and processes during the design, construction, and operation of the built environment. This is a guide to LEED® v4.1 for commercial and residential Building Design and Construction (BD+C) projects and how Owens Corning products can help a project achieve LEED® certification.

BUILDING DESIGN AND CONSTRUCTION (BD+C)

The LEED v4.1 BD+C rating system is used to certify New Construction, Core and Shell, Schools, Retail, Data Centers, Warehouses and Distribution Centers, Hospitality, and Healthcare projects.

Prerequisites and credits in the LEED v4.1 BD+C rating system address the following categories:

- Integrative Process (IP)
- Location and Transportation (LT)
- Sustainable Sites (SS)
- Water Efficiency (WE)
- Energy and Atmosphere (EA)
- Materials and Resources (MR)
- Indoor Environmental Quality (EQ)
- Innovation (IN)
- Regional Priority (RP)

LEED® prerequisites and credit opportunities are project-focused, rather than product-focused (i.e., a project may achieve LEED® certification, but individual products cannot). It is the cumulative effect of products integrated within building systems and assemblies evaluated within the parameters of each of the topics that contributes to the points a project accrues during the certification process.

BUILDING TYPES

- **New Construction and Major Renovations.** New construction or major renovation of buildings that do not primarily serve K–12 educational, retail, data centers, warehouses and distribution centers, hospitality, or healthcare uses.
- **Core and Shell Development.** Buildings that are new construction or major renovation for the exterior shell and core mechanical, electrical, and plumbing units, but not a complete interior fit-out. LEED® BD+C: Core and Shell is the appropriate rating system to use if more than 40% of the gross floor area is incomplete at the time of certification.
- **Schools.** Buildings made up of core and ancillary learning spaces on K–12 school grounds. LEED® BD+C: Schools may optionally be used for higher education and non-academic buildings on school campuses.
- **Retail.** Buildings used to conduct the retail sale of consumer product goods. Includes both direct customer service areas (showroom) and preparation or storage areas that support customer service.
- **Data Centers.** Buildings specifically designed and equipped to meet the needs of high-density computing equipment such as server racks, used for data storage and processing. LEED® BD+C: Data Centers only addresses whole building data centers (greater than 60%).
- **Warehouses and Distribution Centers.** Buildings used to store goods, manufactured products, merchandise, raw materials, or personal belongings, such as self-storage.

- **Hospitality.** Buildings dedicated to hotels, motels, inns, or other businesses within the service industry that provide transitional or short-term lodging with or without food.
- **Healthcare.** Buildings that serve individuals who seek medical treatment, including licensed and federal inpatient care facilities, licensed and federal outpatient care facilities, and licensed and federal long-term care facilities. May optionally be used for buildings with other kinds of medically related uses, such as unlicensed outpatient facilities, medical, dental, and veterinary offices and clinics, assisted living facilities, and medical education and research centers.

RESIDENTIAL BD+C

LEED v4.1 presents a new approach to residential projects that consolidates all residential rating systems and guidance into a single program.

BUILDING TYPES

- **Single Family Homes.** New single-family homes that are attached or detached, and multifamily buildings with up to four units.
- **Multifamily Homes.** Applicable to any predominantly multifamily building with two or more units and any number or stories.
- **Multifamily Homes Core and Shell.** Multifamily buildings that are new construction or major renovation for the exterior shell and core mechanical, electrical, and plumbing units, but not a complete interior fit-out. It is the appropriate rating system to use if more than 40% of the gross floor area is incomplete at the time of certification.
