# Innovations in strength and versatility.

From design, to application, to load requirements — every project presents unique challenges. Strong-Wall® shearwalls from Simpson Strong-Tie offer consistent, reliable performance no matter what the variables are. Our innovative wood and steel options provide maximum flexibility, ease of installation and code-listed, industry-leading strength for every job. And backed by our unparalleled technical and field support, your shearwall installations will be faster, stronger and smarter than ever.

## Introduction

For more than 60 years, Simpson Strong-Tie has focused on creating structural products that help people build safer and stronger homes and buildings. A leader in structural systems research and technology, Simpson Strong-Tie is one of the largest suppliers of structural building products in the world. The Simpson Strong-Tie commitment to product development, engineering, testing and training is evident in the consistent quality and delivery of its products and services.

For more information, visit the company's website at [strongtie.com](http://strongtie.com).

The Simpson Strong-Tie Company Inc. No-Equal Pledge® includes:

- Quality products value-engineered for the lowest installed cost at the highest-rated performance levels
- The most thoroughly tested and evaluated products in the industry
- Strategically located manufacturing and warehouse facilities
- National code agency listings
- The largest number of patented connectors in the industry
- Global locations with an international sales team
- In-house R&D and tool and die professionals
- In-house product testing and quality control engineers
- Support of industry groups including AISI, AITC, ASTM, ASCE, AWC, AWP, ACI, AISC, CSI, CFSEI, ICFA, NBMDA, NLBMDA, SDI, SETMA, SFA, SFIA, STAFDA, SREA, NFBA, TPI, WDSC, WIJMA, WTCA and local engineering groups

## The Simpson Strong-Tie Quality Policy

We help people build safer structures economically. We do this by designing, engineering and manufacturing No-Equal® structural connectors and other related products that meet or exceed our customers' needs and expectations. Everyone is responsible for product quality and is committed to ensuring the effectiveness of the Quality Management System.

Karen Colonias  
Chief Executive Officer

## Getting Fast Technical Support

When you call for engineering technical support, we can help you quickly if you have the following information at hand. This will help us to serve you promptly and efficiently.

- Which Simpson Strong-Tie® catalog are you using?  
(See the front cover for the form number.)
- Which Simpson Strong-Tie product are you using?
- What are the design requirements (i.e., loads, anchor diameter, base material, edge/spacing distance, etc.)?

## What's New

### Simpson Strong-Tie® Strong-Wall® High-Strength Wood Shearwall (WSWH)

The new Strong-Wall high-strength wood shearwall (WSWH) retains the field customization features of the Strong-Wall wood shearwall while dramatically improving performance. Patented wood fuse technology provides predictable behavior and delivers increased strength, stiffness, ductility and design values. The top of wall shear transfer is now accomplished with a single plate that is fastened with custom shearwall screws, which are supplied with the wall. All walls 100" and less are also supplied with portal straps for use in portal applications.

The WSWH series is effective in resisting forces resulting from high wind and earthquakes. New and improved reusable templates locate the holdown anchor bolts accurately for multiple footing types. The WSWH series is suitable for residential, multi-family and light-frame commercial construction for both single and back-to-back installations. The WSWH series replaces the WSW series of wood shearwalls.

### Strong-Wall Wood Shearwall (WSW) Being Phased Out in 2021

The WSW is being replaced by the patented, next generation Strong-Wall high-strength wood shearwall. Availability of the WSW is guaranteed until June 30, 2021. Please use either the Strong-Wall high-strength wood shearwall or Steel Strong-Wall shearwall as a replacement.

## Strong-Wall® Shearwall Selector Application

This application helps design professionals select an appropriate Simpson Strong-Tie Steel Strong-Wall or Strong-Wall High-Strength Wood Shearwall.

#### Optimized Solution

Provides the most cost-effective Strong-Wall solution based on the input shear load.

#### Manual Solution

Allows designers to choose which type and number of walls to meet their requirements.

- ◆ Finds lowest cost solution
- ◆ Provides actual drift and uplift values
- ◆ Provides solutions for different model Codes
- ◆ Includes new anchorage solutions
- ◆ Saves, exports and prints solutions

You can find the Strong-Wall Shearwall Selector application at [strongtie.com/swss](http://strongtie.com/swss).

## Strong-Wall® Bracing Selector

The Strong-Wall Bracing Selector (SWBS) provides pre-engineered Strong-Wall alternatives to code-prescribed braced wall panels. Strong-Wall model numbers and foundation anchorage designs are determined to meet job specific requirements and provide the narrowest bracing solutions possible. This app can be used with the Wall-Bracing-Length Calculator: Start with the WBLC to determine wall bracing length requirements then export project information and bracing requirements to the SWBS.

# Important Information and General Notes

## Warning

Simpson Strong-Tie Company Inc. structural connectors, anchors, and other products are designed and tested to provide specified design loads. To obtain optimal performance from Simpson Strong-Tie Company Inc. products and achieve maximum allowable design load, the products must be properly installed and used in accordance with the installation instructions and design limits provided by Simpson Strong-Tie Company Inc. To ensure proper installation and use, designers and installers must carefully read the following General Notes, General Instructions for the Installer and General Instructions for the Designer, as well as consult the applicable catalog pages for specific product installation instructions and notes.

Proper product installation requires careful attention to all notes and instructions, including these basic rules:

1. Be familiar with the application and correct use of the product.
2. Follow all installation instructions provided in the applicable catalog, website, Installer's Pocket Guide or any other Simpson Strong-Tie publications.
3. Install all required fasteners per installation instructions provided by Simpson Strong-Tie Company Inc.: a) use proper fastener type; b) use proper fastener quantity; c) fill all fastener holes; d) do not overdrive or underdrive nails, including when using gun nailers; and e) ensure screws are completely driven.
4. Only bend products that are specifically designed to be bent. For those products that require bending, do not bend more than once.

In addition to following the basic rules provided above as well as all notes, warnings and instructions provided in the catalog, installers, designers, engineers and consumers should consult the Simpson Strong-Tie Company Inc. website at [www.strongtie.com](http://www.strongtie.com) to obtain additional design and installation information, including:

- Instructional builder/contractor training is available in both English and Spanish;
- Information on workshops Simpson Strong-Tie conducts at various training centers throughout the country;
- Product specific installation videos;
- Specialty catalogs;
- Code reports;
- Technical fliers and bulletins;
- Engineering letters;
- Master format specifications;
- Material safety data sheets;
- Corrosion information;
- Simpson Strong-Tie Drawing Finder;
- Simpson Strong-Tie Strong-Wall® Selector web application; and
- Answers to frequently asked questions and technical topics.

Failure to fully follow all of the notes and instructions provided by Simpson Strong-Tie Company Inc. may result in improper installation of products. Improperly installed products may not perform to the specifications set forth in this catalog and may reduce a structure's ability to resist the movement, stress, and loading that occurs from gravity loads as well as impact events such as earthquakes and high velocity winds.

Simpson Strong-Tie Company Inc. does not guarantee the performance or safety of products that are modified, improperly installed or not used in accordance with the design and load limits set forth in this catalog.

## General Notes

**These general notes are provided to ensure proper installation of Simpson Strong-Tie Company Inc. products and must be followed fully.**

- a. Simpson Strong-Tie Company Inc. reserves the right to change specifications, designs and models without notice or liability for such changes.
- b. Steel used for each Simpson Strong-Tie® product is individually selected based on the product's steel specifications, including strength, thickness, formability, finish and weldability. Contact Simpson Strong-Tie for steel information on specific products.
- c. Unless otherwise noted, dimensions are in inches, loads are in pounds.
- d. Unless otherwise noted, welds, screws, bolts and nails may not be combined to achieve highest load value. 8d (0.131" x 2½"), 10d (0.148" x 3") and 16d (0.162" x 3½") specify common nails that meet the requirements of ASTM F1667. When a shorter nail is specified, it will be noted (for example 8d x 1½"). Refer to Simpson Strong-Tie Nailing Guide, NDS (National Design Specification) and ASTM F1667 (American Society of Testing and Materials) for more nail information.
- e. Do not overload. Do not exceed catalog allowable loads, which would jeopardize the connection.
- f. Unless otherwise noted, allowable loads are for Douglas fir-larch under continuously dry conditions. Allowable loads for other species or conditions must be adjusted according to the code. The section from the AC13 criteria indicating the range of specific gravity reads as follows: A3.2.3. The species of lumber used shall have a specific

gravity not greater than 0.55 as determined in accordance with the NDS. This chart shows specific gravity and perpendicular-to-grain compression capacities for the different wood species:

Species	F <sub>C</sub> ⊥	Specific Gravity
Douglas Fir-Larch (DF)	625 psi	0.50
Southern Pine (SP)	565 psi	0.55
Spruce-Pine-Fir (SPF)	425 psi	0.42
Spruce-Pine-Fir South (SPF-S)	335 psi	0.36
Hem-Fir (HF)	405 psi	0.43
Glulam	650 psi	0.50
LVL (DF/SP)	750 psi	0.50
LSL (E = 1.3 x 10 <sup>6</sup> )	680 psi	0.50
LSL (E ≥ 1.5 x 10 <sup>6</sup> )	880 psi	0.50
Parallam® PSL	750 psi	0.50

- g. All references to bolts or machine bolts (MBs) are for structural quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM Standard A307, Grade A.
- h. Unless otherwise noted, bending steel in the field may cause fractures at the bend line. Fractured steel will not carry load and must be replaced.
- i. A fastener that splits the wood will not resist the design load. Evaluate splits to determine if the connection will perform as required. Dry wood may split more easily and should be evaluated

# Important Information and General Notes

- as required. If wood tends to split, consider pre-boring holes with diameters not exceeding 0.75 of the nail diameter (2018 NDS Section 12.1.6.2). Use a  $\frac{5}{32}$ " bit for Strong-Drive® SDS Heavy-Duty Connector screws and a  $\frac{3}{32}$ " bit for Strong-Drive SD9/SD10 and Strong-Wall SWS16150 Connector screws.
- j. Wood shrinks and expands as it loses and gains moisture, particularly perpendicular to its grain. Take wood shrinkage into account when designing and installing connections. Simpson Strong-Tie manufactures products to fit common dry lumber dimensions. If you need a connector with dimensions other than those listed in this catalog, Simpson Strong-Tie may be able to vary connector dimensions; contact Simpson Strong-Tie. The effects of wood shrinkage are increased in multiple lumber connections, such as floor-to-floor installations. This may result in the vertical rod nuts becoming loose, requiring post-installation tightening. (Contact Simpson Strong-Tie for information on Takeup Devices.)
  - k. Built-up lumber (multiple members) must be fastened together to act as one unit to resist the applied load (excluding the connector fasteners). This must be determined by the designer.
  - l. Some model configurations may differ from those shown in this catalog. Contact Simpson Strong-Tie for details.
  - m. Do not weld products listed in this catalog unless this publication specifically identifies a product as acceptable for welding, or unless specific approval for welding is provided in writing by Simpson Strong-Tie. Some steels have poor weldability and a tendency to crack when welded. Cracked steel will not carry load and must be replaced.

## General Instructions for the Installer

These general instructions for the installer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific installation instructions and notes provided for each particular product, all of which should be consulted prior to and during installation of Simpson Strong-Tie Company Inc. products.

- a. All specified fasteners must be installed according to the instructions in this catalog. Incorrect fastener quantity, size, placement, type, material, or finish may cause the connection to fail. Prior to using a particular fastener, please consult the Fastener Guide on our website at [strongtie.com](http://strongtie.com).
  - 16d fasteners are common nails (0.162" dia. x 3 1/2" long) and cannot be replaced with 16d sinkers (0.148" dia. x 3 1/4" long) for full load value unless otherwise specified.
  - Unless otherwise noted screws may not be used to replace nails in connectors unless approved and recommended by the Designer/Engineer of Record. Unless stated otherwise, Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of connectors with screws replacing nails.
  - When using stainless-steel connectors, use stainless-steel fasteners. When using ZMAX®/HDG galvanized connectors, use fasteners that meet the zinc coating specifications of ASTM A153 or other fasteners allowed in this catalog.
- b. Fill all fastener holes as specified in the installation instructions for that product.
- c. Do not overdrive nails. Overdriven nails reduce shear capacity.
- d. Use the materials specified in the installation instructions. Substitution of or failure to use specified materials may cause the connection to fail.
- e. Do not add fastener holes or otherwise modify Simpson Strong-Tie Company Inc. products. The performance of modified products may be substantially weakened. Simpson Strong-Tie will not warrant or guarantee the performance of such modified products.
- f. Install products in the position specified in the catalog.
- g. Do not alter installation procedures from those set forth in this catalog.
- h. Bolt holes shall be at least a minimum of  $\frac{1}{32}$ " and no more than a maximum of  $\frac{1}{16}$ " larger than the bolt diameter (per the 2018 NDS, Section 12.1.3.2 and AISI S100-16, Table J3-1 if applicable).
- i. Install all specified fasteners before loading the shearwall.
- j. Some hardened fasteners may have premature failure if exposed to moisture. These fasteners are recommended to be used in dry interior applications.
- k. Use proper safety equipment.
- l. Welding galvanized steel may produce harmful fumes; follow proper welding procedures and safety precautions. Welding should be in accordance with A.W.S. (American Welding Society) standards. Unless otherwise noted Simpson Strong-Tie® connectors cannot be welded.
- m. Pneumatic or powder-actuated fasteners may deflect and injure the operator or others. Pneumatic nail tools may be used to install connectors, provided the correct quantity and type of nails (length and diameter) are properly installed in the nail holes. Tools with nail hole-locating mechanisms should be used. Follow the manufacturer's instructions and use the appropriate safety equipment. Overdriving nails may reduce allowable loads. Contact Simpson Strong-Tie. Powder-actuated fasteners should not be used to install connectors, unless noted otherwise.
- n. For cold-formed steel applications, all screws shall be installed in accordance with the screw manufacturer's recommendations. All screws shall penetrate and protrude through the joined materials a minimum of 3 full exposed threads per AISI Standard for Cold Formed Steel Framing — General Provisions, Section D1.3, if applicable.
- o. Nuts shall be installed such that the end of the threaded rod or bolt is at least flush with the top of the nut.
- p. To achieve tabulated values for embedded concrete/masonry products, full consolidation of concrete or grout is required.
- q. Drilling, sawing, sanding or machining wood products generates wood dust, a substance known to the State of California to cause cancer. For more information on Proposition 65, visit [oehha.ca.gov](http://oehha.ca.gov).
- r. For additional installation information, visit the Simpson Strong-Tie page at [youtube.com/strongtie](http://youtube.com/strongtie).

# Important Information and General Notes

## General Instructions for the Designer

These general instructions for the designer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the design process.

- a. The term “designer” used throughout this catalog is intended to mean a licensed/certified building design professional, a licensed professional engineer, or a licensed architect.
- b. All connected members and related elements shall be designed by the designer.
- c. All installations should be designed only in accordance with the allowable load values set forth in this catalog.
- d. Simpson Strong-Tie strongly recommends the following addition to construction drawings and specifications: “Simpson Strong-Tie® products are specifically required to meet the structural calculations of the plan. Before substituting another brand, confirm load capacity based on reliable published testing data or calculations. The Engineer/Designer of Record should evaluate and give written approval for substitution prior to installation.”
- e. For cold-formed steel applications, as a minimum all screws must comply with Society of Automotive Engineers (SAE) Standard J78, Steel Self-Drilling/Tapping Screws, and must have a Type II coating in accordance with ASTM B 633, Electrodeposited Coatings of Zinc on Iron and Steel. Screw strength shall be calculated in accordance with AISI S100-16 Section J4, if applicable, or shall be based on the manufacturer’s design capacity determined from testing.
- f. Local and/or regional building codes may require meeting special conditions. Building codes often require special inspection of anchors installed in concrete and masonry. For compliance with these requirements, it is necessary to contact the local and/or regional building authority. Except where mandated by code, Simpson Strong-Tie products do not require special inspection.
- g. For Masterformat® specifications, visit [strongtie.com/literature/masterformat.html](http://strongtie.com/literature/masterformat.html).

## Limited Warranty

Simpson Strong-Tie Company Inc. warrants catalog products to be free from defects in material or manufacturing. Simpson Strong-Tie Company Inc. products are further warranted for adequacy of design when used in accordance with design limits in this catalog and when properly specified, installed and maintained. This warranty does not apply to uses not in compliance with specific applications and installations set forth in this catalog, or to non-catalog or modified products, or to deterioration due to environmental conditions.

Simpson Strong-Tie® connectors are designed to enable structures to resist the movement, stress and loading that results from impact events such as earthquakes and high-velocity winds. Other Simpson Strong-Tie products are designed to the load capacities and uses listed in this catalog. Properly-installed Simpson Strong-Tie products will perform in accordance with the specifications set forth in the applicable Simpson Strong-Tie catalog. Additional performance limitations for specific products may be listed on the applicable catalog pages.

Due to the particular characteristics of potential impact events, the specific design and location of the structure, the building

materials used, the quality of construction, and the condition of the soils involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie catalog specifications and Simpson Strong-Tie connectors are properly installed in accordance with applicable building codes.

All warranty obligations of Simpson Strong-Tie Company Inc. shall be limited, at the discretion of Simpson Strong-Tie Company Inc., to repair or replacement of the defective part. These remedies shall constitute Simpson Strong-Tie Company Inc.’s sole obligation and sole remedy of purchaser under this warranty. In no event will Simpson Strong-Tie Company Inc. be responsible for incidental, consequential, or special loss or damage, however caused.

**This warranty is expressly in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded. This warranty may change periodically — consult our website [strongtie.com](http://strongtie.com) for current information.**

## Terms and Conditions of Sale

### Product Use

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used with other connectors not approved by a qualified designer. Modifications to products or changes in installations should only be made by a qualified designer. The performance of such modified products or altered installations is the sole responsibility of the designer.

### Indemnity

Customers or designers modifying products or installations, or designing non-catalog products for fabrication by Simpson Strong-Tie Company Inc. shall, regardless of specific instructions to the user, indemnify, defend and hold harmless Simpson Strong-Tie Company Inc. for any and all claimed loss or damage occasioned in whole or in part by non-catalog or modified products.

### Non-Catalog and Modified Products

Consult Simpson Strong-Tie Company Inc. for applications for which there is no catalog product, or for connectors for use in hostile environments, with excessive wood shrinkage, or with abnormal loading or erection requirements.

Non-catalog products must be designed by the customer and will be fabricated by Simpson Strong-Tie in accordance with customer specifications.

Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of non-catalog products. Simpson Strong-Tie provides no warranty, express or implied, on non-catalog products.

# Stronger. Easier. More versatile.

The code-listed Strong-Wall® high-strength wood shearwall is an extremely versatile solution for lateral-force resistance in residential, multi-family and light-frame commercial construction. Field-trimmable to suit your exact design needs and code-listed, its patented new design provides higher allowable loads for every application.

All Strong-Wall® high-strength wood shearwalls are supplied with top-of-wall shear transfer plates and required fasteners, heavy hex nuts, heavy bearing plates, and installation instructions. Additionally, shearwalls 100 inches or less in height are supplied with four portal straps.

# Standard and Balloon Framing on Concrete Foundations

Simpson Strong-Tie® Strong-Wall® high-strength wood shearwalls combine design flexibility with performance. Field trimmable, they can be customized to accommodate varying heights or rake walls. They are evaluated to the 2018 IRC/IBC and are listed by ICC-ES.

## Installation

- All panels may be field trimmed to a minimum of 74½". Trim height from top of panel only, do not trim from sides or bottom. Drilling holes in the Strong-Wall high-strength wood shearwalls is not allowed except as shown on p. 36.
- Anchor bolt nuts should be finger tight plus ½ turn.
- Maximum shim thickness between the shearwall and top plates or header is ⅞". For additional shim thicknesses, see detail 9/WSWH2 on p. 35.
- Walls may also be used in 2x6 wall framing. Install the panel flush to the outside face of the framing and add furring to the opposite face as required to accommodate finish material. See detail 6/WSWH2 on p. 33.
- Top connection installs with a combination of SDS25600 Heavy-Duty Connector screws and SWS16150 Strong-Wall screws.

**Codes:** ICC-ES ESR-2652, City of LA Building Code Supplement and State of Florida FL5113

1. To achieve evaluated panel heights listed in the allowable load table or for those not listed, order the next tallest panel and trim to fit. Minimum trimmed height for all panels is 74½".
2. All panels are supplied with preattached holdowns, two heavy hex nuts, two heavy bearing plates, one WSWH-TP top connection plate (width based on panel model), required fasteners and installation instructions.
3. All panels are 3½" thick.

### Rake Wall Application

### First-Story Installation with Wood Floor System

Specify panel height from top of foundation to underside of the top plates or beam.

- Allowable shear loads are applicable to installations on concrete with specified compressive strengths as listed using the ASD basic (IBC Section 1605.3.1) or the alternative basic (IBC Section 1605.3.2) load combinations.
- Load values include evaluation of bearing stresses on concrete foundations and do not require further evaluation by the designer. For installations on masonry foundations, bearing capacity shall be evaluated by the designer.
- Seismic design based on 2018 IBC using R = 6.5. For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet-steel panels.
- Allowable vertical load denotes the total maximum concentric vertical load permitted on the panel acting in combination with the allowable shear loads.
- Allowable shear, drift and anchor tension values may be interpolated for intermediate height or vertical loads. For panels 74½"–78" tall, use the values for a 78"-tall panel.
- To achieve required WSWH panel evaluation height, trim next tallest full-height panel defined in table on p. 13.
- Drifts at lower design shear may be linearly reduced.
- See p. 16 for allowable out-of-plane and axial capacities.
- Angled SDS screws may be omitted from the WSWH-TP top connection for all panels taller than 100"; see p. 16 as reduced allowable out-of-plane loads may apply.
- High-strength anchor bolts are required for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 22–23. See pp. 21–29 for WSWH-AB anchor bolt information and anchorage solutions.
- Tabulated anchor tension values assume no resisting vertical load. Anchor tension loads at design shear values and including the effect of vertical load may be determined using the following equation:  

$$T = [(V \times H) / B] - P/2$$
, where:  
 T = Anchor tension load (lb.)  
 V = Design shear load (lb.)  
 P = Applied vertical load (lb.)  
 H = Panel height (in.)  
 B = Moment arm (in.); 7.625" for WSWH12, 12.50" for WSWH18, 17.50" for WSWH24.

# Standard and Balloon Framing on Concrete Foundations

		WSWH24	215	180	150	110	85	65	N/A	N/A	N/A	N/A	N/A

1. Loads shown are at ASD level in pounds per square foot with no further increase allowed.
2. Loads consider a maximum deflection limit of H/240.
3. Allowable out-of-plane loads can be applied in combination with the allowable vertical loads shown on pp. 14–15.
4. Angled SDS screws may be omitted for WSWH panels taller than 100" in standard applications; however, SWS16150 screws must be installed for all fastening conditions. When angled SDS screws are omitted, a reduced allowable out-of-plane load may apply.
5. Allowable values for header panel attachment assume a maximum header depth of 12". Use a load reduction factor of 0.94, 0.88 and 0.82 for 14", 16" and 18" deep headers respectively.
6. Allowable values shown for header panel attachment require the use of the portal straps to resist header rotation.
7. N/A = Not Applicable.

## Allowable Axial Loads for Single-Story Walls on Concrete Foundations (lb.)

Strong-Wall High-Strength Wood Shearwall Model No.	Nominal Height of Shearwall (ft.)										
	7	8	9	10	11	12	13	14	16	18	20
WSWH12	30,700	22,400	17,900	14,600	12,100	9,800	N/A	N/A	N/A	N/A	N/A

1. Allowable ASD vertical load is the lesser of the WSWH panel buckling capacity and concrete bearing capacity beneath the holdowns assuming a minimum specified concrete compressive strength  $f'_c = 2,500$  psi.
2. Allowable vertical loads assume concentric point load or uniformly distributed load without lateral loads present. For combined lateral and vertical loads, see pp. 14–15.
3. Tabulated loads apply to single-story panels on concrete foundations.
4. N/A = Not Applicable.

# Garage Portal Systems on Concrete Foundations

The Strong-Wall® high-strength wood shearwall garage portal system provides higher allowable shear load with reduced concrete anchorage requirements. Portal walls may be used in single- or double-portal applications and shall be installed with a minimum 3" x 11¼" single- or multi-ply header depending upon loading and span requirements.

**Codes:** ICC-ES ESR-2652, City of LA Building Code Supplement and State of Florida FL5113

For product data and naming scheme information, see pp. 12–13.

	93¼	5½	8'-2¾" <sup>2</sup>
		6	8'-3¼" <sup>2</sup>

1. If required rough opening height exceeds table value, specify next taller panel and trim as necessary. The Strong-Wall high-strength wood shearwalls may be trimmed to a minimum height of 74½".
2. Furring down garage header may be required for correct rough opening height.

## Installation

- Portal-frame connection kit is required for portal-frame applications.
- All panels may be trimmed to a minimum of 74½". Trim height from top of panel only, do not trim from sides or bottom. Drilling holes in the Strong-Wall high-strength wood shearwalls is not allowed except as shown on p. 36.
- Anchor bolt nuts should be finger tight plus ½ turn.
- Maximum shim thickness between Strong-Wall high-strength wood shearwalls and the top plates or header is ⅞".
- Top connection installs with a combination of ¼" x 6" SDS Heavy-Duty Connector screws and SWS16150 Strong-Wall screws.
- Walls may also be used in 2x6 wall framing. Install the panel flush to the outside face of the framing and add furring to the opposite side.
- Walls may be installed with solid or multi-ply headers, see details 3, 4, 5, 6/WSWH4 for fastening and furring requirements on pp. 38–39.

## Portal Frame Connection Kit

Model No.	Contents
WSWH-PK	4 (10-gauge) WSWH-PS straps

1. Portal-frame connection kit comes with panels that are 100" or less in height. The kit must be ordered separately for panels over 100" tall.

**Single Portal Installation**  
US Patent 10,711,477

# Garage Portal Systems on Concrete Foundations

## Portal Design Information

A portal frame under lateral loads causes the portal header to experience internal stresses in addition to those created by the primary loads (live, dead and snow). These additional stresses are called induced forces and must be considered when designing portal headers. To account for the induced forces from lateral loads, a concentrated end moment equal to the top-of-panel moment must be placed at the end of the header that is connected to the WSWH panel. For the WSWH12, WSWH18 and WSWH24, the moment induced into the portal header must be taken as 20%, 10% and 0%, respectively, of the total lateral moment at the base. The total lateral moment is calculated as the design shear times the panel height. For headers with typical residential uniform loads, the induced moment and shear forces from a portal-frame system do not control the design. This is due to the 1.60 load duration factor ( $C_D$ ) used in design when wind and seismic loads are included.

The lateral and vertical loads shown on p. 19 for portal frames assume that the header size falls within the portal-frame parameters listed in the table below.

### Strong-Wall® High-Strength Wood Shearwall Portal Header Design Parameters

Header Design Parameter	Allowable Range
Width	3" – 5½"
Depth	11¼" – 18"
Clear Span	8' – 18' 6"
K	90 lb./in. – 4,000 lb./in.

1. Single- or multi-ply header members may be used.
2. Maximum clear span for multi-ply 2x DF/SP header shall be limited to 16'-4".
3. Secondary moment, shear and axial forces shall be considered in header design.
4. Header design shall be by designer and assume gravity loads only induce simple span moments in beam.
5. Header stiffness (K) for use in WSWH portal system may be determined using the following equation:  
$$K = (E \times b \times d^3) / 12L^3$$
 where:  
E = Header modulus of elasticity (psi)  
b = Header width (in.)  
d = Header depth (in.)  
L = Header clear span (in.)

## Alternative Garage Front Options

These alternative garage-front options may be used for applications when the Strong-Wall® high-strength wood shearwall is installed at the full height (option 1) or without the additional Portal-Frame Kit (option 2), when higher allowable load or reduced concrete anchorage is not needed. Refer to the Standard Application on Concrete Foundations on pp. 12–16 for product data and allowable load values.

### For Garage Wall Option 2, the designer shall design for:

1. Shear transfer
2. Out-of-plane loading effect
3. Increased overturning and drift due to additional height

- Allowable shear loads are applicable to installations on concrete with specified compressive strengths as listed using the ASD basic (IBC Section 1605.3.1) or the alternative basic (IBC Section 1605.3.2) load combinations.
- Load values include evaluation of bearing stresses on concrete foundations and do not require further evaluation by the designer. For installations on masonry foundations, bearing capacity shall be evaluated by the designer.
- Seismic design based on 2018 IBC using  $R = 6.5$ . For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet-steel panels.
- Allowable values shown apply to single-wall garage portal systems. The allowable shear load for a double-wall garage portal system, which consists of two walls with a header continuous across both panels, may be taken as twice the table value.
- Allowable vertical load denotes the total maximum concentric vertical load permitted on the panel acting in combination with the allowable shear loads.
- Allowable shear, drift and anchor tension values may be interpolated for intermediate height or vertical loads. For panels 74½"–78" tall, use the values for a 78"-tall panel.
- To achieve required WSWH panel evaluation height, trim next tallest full-height panel defined in table on p. 13.
- Drifts at lower design shear may be linearly reduced.
- See p. 16 for allowable out-of-plane and axial capacities.
- High-strength anchor bolts are required for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 22–23. See pp. 21–29 for WSWH-AB anchor bolt information and anchorage solutions.
- Tabulated anchor tension values assume no resisting vertical load. Anchor tension loads at design shear values and including the effect of vertical load may be determined using the following equation:  

$$T = [(k \times V \times H) / B] - P/2$$
, where:  
 $T$  = Anchor tension load (lb.)  
 $V$  = Design shear load (lb.)  
 $P$  = Applied vertical load (lb.)  
 $H$  = Panel height (in.)  
 $B$  = Moment arm (in.); 7.625" for WSWH12, 12.50" for WSWH18 and 17.50" for WSWH24  
 $k$  = Portal factor; 0.80 for WSWH12 panels 93¼" or less in height,  
0.90 for WSWH18 panels 93¼" or less in height,  
1.00 for all other panels.

## Back-to-Back Installations on Concrete Foundations

The Strong-Wall® high-strength wood shearwall may be installed in a back-to-back orientation in residential, multi-family and light-commercial applications for cases where maximum allowable loads are required and a special moment frame might otherwise be specified. The allowable ASD shear loads for back-to-back installations may be taken as twice those listed for standard applications in the table on pp. 14–15. Double 2x8 top plates are required for standard applications and a minimum 7" x 11¼" header is required for single- or double-portal applications depending upon loading and span requirements. Back-to-back anchorage solutions for spread footings and reinforced grade beam foundations are provided in detail sheets WSWH1.2 and WSWH1.3, and may be downloaded in PDF, DWG or DXF format at [strongtie.com](http://strongtie.com).

**Codes:** ICC-ES ESR-2652, City of LA Building Code Supplement and State of Florida FL5113

For product data and naming scheme, see pp. 12–13.

### Installation

- Portal-frame connection kit is required for portal frame applications (one WSWH-PK kit required for both panels; straps installed on outside panel faces only).
- Allowable out-of-plane loads listed on p. 16 for single-story walls on concrete foundations shall apply and may not be increased.
- See garage header rough opening height table on p. 17.
- All panels may be field trimmed to a minimum of 74½". Trim height from top of panel only, do not trim from sides or bottom. Drilling holes in the Strong-Wall high-strength wood shearwalls is not permitted except as shown on p. 36.
- Anchor bolt nuts should be finger tight plus ½ turn.
- Maximum shim thickness between the shearwall and top plates or header is ⅞". For additional thicknesses, see detail 9/WSWH2 on p. 35.
- Top connection installs with a combination of ¼" x 6" SDS Heavy-Duty Connector screws and SWS16150 Strong-Wall screws. See details 7/WSWH2 and 3/WSWH4 on pp. 33 and 38 for standard and portal applications, respectively.

### Back-to-Back Portal Installation (Standard Installation Similar)

# High-Strength Wood Shearwall Anchorage Solutions

## WSWH-AB Anchor Bolts

WSWH-AB anchor bolts in 1" diameters offer flexibility to meet specific project demands. Inspection is easy; the head is stamped with a No-Equal® symbol for identification, bolt length, bolt diameter, and optional "HS" for "High-Strength" if specified.

**Material:** ASTM F1554 Grade 36;  
High-Strength (HS) ASTM A193 Grade B7

An additional nut for template installation is provided with each WSWH-AB.

Strong-Wall® High-Strength Wood Shearwall Model No.	Model No.	Dia. (in.)	Total Length (in.)	$l_e$ (in.)
WSWH12 WSWH18 WSWH24	WSWH-AB1x24	1	24	15½
	WSWH-AB1x24HS	1	24	15½
	WSWH-AB1x30	1	30	21½
	WSWH-AB1x30HS	1	30	21½
	WSWH-AB1x36	1	36	27½
	WSWH-AB1x36HS	1	36	27½

## WSWH-HSR Extension Kit

WSWH-HSR allows for anchorage in tall stemwall applications where full embedment of a WSWH-AB into the footing is required. The head is stamped for identification like a WSWH-AB. Kit includes ASTM A193 Grade B7 high-strength rod with heavy hex nut fixed in place and high-strength coupler nut.

Strong-Wall High-Strength Wood Shearwall Model No.	Model No.	Dia. (in.)	Total Length (in.)	$l_e$ (in.)
WSWH12 WSWH18 WSWH24	WSWH-HSR1x24KT	1	24	17½
	WSWH-HSR1x36KT	1	36	29½

**Note:** Do not use in place of WSWH-AB.

$$\text{Total } l_e = \text{WSWH-HSR } l_e + \text{WSWH-AB } l_e + 6\frac{1}{2}"$$

1. Anchorage designs conform to ACI 318-14 Chapter 17 and ACI 318-11 Appendix D with no supplementary reinforcement for cracked and uncracked concrete as noted.
2. Anchor strength indicates required grade of WSWH-AB anchor bolt. Standard (ASTM F1554 Grade 36) or high strength (HS) (ASTM A193 Grade B7).
3. Seismic indicates Seismic Design Categories C through F. Detached one- and two-family dwellings in SDC C may use wind anchorage solutions. Seismic anchorage designs conform to ACI 318-14 Section 17.2.3.4.3 and ACI 318-11 Section D.3.3.4.
4. Wind includes Seismic Design Categories A and B and detached one- and two-family dwellings in SDC C.
5. Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by others. The registered design professional may specify alternative embedment, footing size or anchor bolt.
6. Refer to slab on grade, curb, stemwall and interior footing details for W and d<sub>e</sub> as shown on pp. 25–26.

# High-Strength Wood Shearwall Anchorage Solutions

Foundation shear reinforcement to resist shear forces from Strong-Wall® high-strength wood shearwalls located at the edge of concrete is shown in the table below. The WSWH12 used in wind applications does not require shear reinforcement when the panel design shear force is less than the anchorage allowable shear load shown in the table below.

## Shear Anchorage Solutions

Strong-Wall High-Strength Wood Shearwall Model No.	L <sub>t</sub> or L <sub>h</sub> (in.)	Seismic <sup>3</sup>		Wind <sup>4</sup>

WSWH24	19	(2) #3 hairpins <sup>5</sup>	6	(2) #3 hairpins <sup>5</sup>	6		

1. Shear anchorage designs conform to ACI 318-14 Chapter 17 and ACI 318-11 and assume minimum 2,500 psi concrete. See pp. 22–23 for tension anchorage.
2. Shear reinforcement is not required for interior foundation applications (panel installed away from edge of concrete), or braced wall panel applications.
3. Seismic indicates seismic design category C through F. Detached one- and two-family dwellings in SDC C may use wind anchorage solutions. Seismic shear reinforcement designs conform to ACI 318-14, section 17.2.3.5.3 and ACI 318-11 section D.3.3.5.
4. Wind includes seismic design category A and B and detached one- and two-family dwellings in SDC C.
5. Additional ties may be required at garage curb or stemwall installations below anchor reinforcement per designer.
6. Use (1) #3 hairpin for WSWH18 when standard strength anchor is used.
7. Use (1) #3 tie for WSWH12 when panel design shear force exceeds tabulated anchorage allowable shear load.
8. No. 4 grade 40 shear reinforcement may be substituted for WSWH shear anchorage solutions.
9. Concrete edge distance for anchors must comply with ACI 318-14 section 17.7.2 and ACI 318-11 section D.8.2.
10. The designer may specify alternate shear anchorage.

# High-Strength Wood Shearwall Anchor Bolt Templates

Simpson Strong-Tie patented reusable anchor bolt templates help ensure accurate anchor bolt placement for the Strong-Wall® high-strength wood shearwalls. They are available in multiple configurations to accommodate common concrete foundation types.

## Anchor Bolt Templates

Strong-Wall High-Strength Wood Shearwall Model No.	Model Width (in.)	Anchor Bolt Stabilizer Model No.	Strong-Wall High-Strength Wood Shearwall Template Model No.			
			Reversible	Panel Form	Brick Ledge	Extended Leg
WSWH12	12½	WSWH-BS12	WSWH-RT12	WSWH-RTPF12	WSWH-RTBL12	WSWH-RTBL12
WSWH18	18	WSWH-BS18	WSWH-RT18	WSWH-RTPF18	WSWH-RTBL18	WSWH-RTBL18
WSWH24	24	WSWH-BS24	WSWH-RT24	WSWH-RTPF24	WSWH-RTBL24	WSWH-RTBL24

1. Templates are recommended and are required in some jurisdictions.
2. Foundation design by the designer.

**WSWH-RT Exterior Installation\***  
US Patent 7,445,192

**WSWH-RT with Anchor Bolt Stabilizers**  
(Anchor bolt stabilizers are sold separately.  
Optional T-shape dowel by others.)

An additional nut for template installation is provided with each WSWH-AB

**Anchor Bolt Height (Exterior)**

**Anchor Bolt Height (Interior)**

**WSWH-RT Interior Installation\***

**WSWH-RTPF**  
(Panel form)  
US Patent 7,445,192

**WSWH-RTBL**  
(Brick ledge)  
US Patent 7,445,192

\*WSWH-RT templates are reversible. Use the same template for interior or exterior applications.

# Anchor Reinforcement Solutions on Grade Beams

Simpson Strong-Tie® provides grade beam anchorage solutions for the Strong-Wall® high-strength wood shearwalls, which have been calculated to conform to ACI 318-14. Through funding from the Structural Engineers Association of Northern California, initial testing at Scientific Construction Laboratories Inc. confirmed the need to comply with ACI 318 requirements to prevent plastic hinging at anchor locations. Follow-up testing at the Simpson Strong-Tie Tyrell Gilb Research Laboratory was then used to confirm these findings and validate performance. The testing consisted of specimens with closed tie anchor reinforcement, non-closed u-stirrups and control specimens without anchor reinforcement. Flexural and shear reinforcement were designed to resist amplified anchorage forces and compared to test beams designed for non-amplified strength level forces. The test program has proven the performance of the anchor reinforcement details developed by Simpson Strong-Tie.

## Signifcant Findings from Testing

Grade beam flexural and shear capacity is critical to anchor performance and must be designed to exceed the demands created by the attached structure. In wind load applications, this demand includes the factored demand from the Strong-Wall high-strength wood shearwalls (WSHW). In seismic applications, testing and analysis have shown that in order to achieve the anchor performance expected by ACI 318 anchorage design methodologies, the concrete member design strength needs to resist the amplified anchor design demand from ACI 318-14 Section 17.2.3.4.3 and ACI 318-11 Appendix D Section D.3.3.4.3. To help designers achieve this, Simpson Strong-Tie recommends designers apply the seismic design moment listed in the table below at the WSWH location when evaluating the grade beam design strength under seismic loads. The tabulated moment correlates to the lowest of the anchor tension design limits defined in the sections listed above as they relate to each WSWH model.

Closed tie anchor reinforcement is critical to maintain the integrity of the reinforced core where the anchor is located. Testing with u-stirrups that did not include complete closed ties showed premature splitting failure of the grade beam.

Grade Beam Testing

## Grade-Beam Anchorage Solutions

Strong-Wall High-Strength Wood Shearwall Model No.	Anchor Bolt Model No.	Anchor Diameter (in.)	Anchor Reinforcement for Wind and Seismic <sup>3,8,9</sup>		Amplified LRFD Applied Design Seismic Moment (ft.-lb.) <sup>4,5,6,7</sup>	
			Standard-Strength WSWH-AB	High-Strength WSWH-ABHS	Standard-Strength WSWH-AB	High-Strength WSWH-ABHS
WSWH12	WSWH-AB1 WSWH-AB1HS	1	(3) #4 Closed Ties / Wall	(7) #4 Closed Ties / Wall	29,500	31,300
WSWH18			(2) #4 Closed Ties / Anchor	(4) #4 Closed Ties / Anchor	48,000	72,900
WSWH24					67,100	103,500

1. Anchor reinforcement conforms to ACI 318-14 Section 17.4.2.9 and ACI 318-11 Section D.5.2.9. Full-scale testing was used to validate anchor reinforcement configuration and placement.
2. Minimum concrete compressive strength,  $f'_c = 2,500$  psi.
3. Closed-tie anchor reinforcement to be ASTM A615 Grade 60 (min.) #4 rebar.
4. Grade-beam longitudinal and tie reinforcement shall be specified by the designer for flexure and shear loading. Design should consider project-specific design loads and allowable soil pressure.
5. Simpson Strong-Tie recommends using the tabulated minimum amplified LRFD applied seismic design moment to ensure grade-beam design flexure and shear strength is adequate to prevent plastic hinge formation under demands associated with anchorage forces corresponding to ACI 318-14 Section 17.2.3.4.3 and ACI 318-11 Section D.3.3.4.3.

6. Designer may use reduced moment due to applied WSWH lateral load. Minimum moment shall be the lesser of the tabulated moment or the amplified LRFD design moment for seismic:  $(ASD \text{ design demand shear}/0.7) \times \Omega_o \times WSWH \text{ wall height for grade-beam design}$ .
7. Minimum grade-beam design moment for wind and seismic in Seismic Design Category A and B and detached one- and two-family dwellings in SDC C:  $(ASD \text{ design demand shear}/0.6) \times WSWH \text{ wall height}$ .
8. Closed tie may be single-piece hoop or two-piece assembly with a u-stirrup with standard 135° hooks and a top cross-tie cap. See detail 6/WSWH1.1.
9. See details for grade-beam anchor reinforcement placement, installation and spacing requirements. Closed tie anchor reinforcement quantity is per wall for the 12" wall model, and per anchor for the 18" and 24" models.

# Shaped for strength.

With a patented shape for better performance and available in a wide variety of sizes, our prefabricated and code-listed Steel Strong-Wall® shearwall offers some of the highest allowable loads in the industry. Its cutting-edge design provides strength, stiffness and ductility, and allows easy access to anchor bolts for fast and efficient installation.

# Standard Application on Concrete Foundations

Simpson Strong-Tie® Steel Strong-Wall® shearwalls provide superior performance, design flexibility and ease of installation. All Steel Strong-Wall shearwalls are evaluated to the 2018 IRC/IBC and are listed by ICC-ES.

**Material:** Vertical Panel—10 gauge

**Finish:** Vertical Panel—Galvanized

Canadian Patent 2,489,845

# Standard Application on Concrete Foundations

## Installation Information

- Do not cut the Steel Strong-Wall® or enlarge existing holes. Doing so will compromise the performance of the wall.
- Do not use an impact wrench to tighten nuts on the anchor bolts.
- Maximum shim thickness between the Steel Strong-Wall and top plates or header is  $\frac{7}{8}$ " using Simpson Strong-Tie® Strong-Drive®  $\frac{1}{4}$ " x  $3\frac{1}{2}$ " SDS Heavy-Duty Connector screws. For top of wall height adjustment, see detail 5/SSW2 on p. 69.
- Walls with 2x4 preattached studs may also be used in 2x6 or 2x8 wall framing. Install the wall flush to one face of the framing and add furring to the opposite side.
- Walls may be installed with solid or multi-ply headers, see detail 11/SSW2 on p. 70 for details.

	7,500	2,280	0.55	19,545	2,280	0.55	19,545

1. Allowable shear loads and anchor tension forces are applicable to installation on concrete with minimum  $f'_c = 2,500$  psi using the ASD basic (Section 1605.3.1) or the alternative basic (Section 1605.3.2) load combinations. Load values include evaluation of bearing stresses on the foundation and do not require further evaluation by the designer.

2. For seismic designs based on the 2018 IBC using  $R = 6.5$ . For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet steel panels.

3. Allowable shear, drift, and anchor tension values may be interpolated for intermediate height or axial loads.

4. High-strength anchor bolts are required for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 60–61. High-strength anchor bolts are required for SSW12 when the seismic overturning moment (seismic shear x shearwall height) exceeds 61,600 in.-lb. See pp. 60–67 for SSWAB anchor bolt information and anchorage solutions.

5. Tabulated anchor tension loads assume no resisting axial load. For anchor tension loads at design shear values and including the effect of axial load, refer to the Strong-Wall Selector web application or use the equations on p. 46. Drifts at lower design shear may be linearly reduced.

6. See p. 45 for allowable out-of-plane loads and axial capacities.

# Standard Application on Concrete Foundations

## Allowable Out-of-Plane Loads (psf) for Single-Story Walls on Concrete Foundations

Model Width (in.)	Axial Load (lb.)	Nominal Height of Shearwall (ft.)					
		8	9	10	11	12	13
12	1,000	200	140	105	N/A	N/A	N/A
	4,000	150	105	70	N/A	N/A	N/A
	7,500	90	55	25	N/A	N/A	N/A
15	1,000	165	130	100	80	70	N/A
	4,000	130	95	70	50	40	N/A
	7,500	95	65	45	30	15	N/A
18	7,500	310	215	160	120	90	70
21	7,500	260	185	135	100	70	50
24	7,500	275	195	135	105	80	65

1. Loads shown are at ASD level in pounds per square foot (psf) of wall with no further increase in load allowed.
2. Axial load denotes maximum gravity load permitted on entire panel acting in combination with the out-of-plane load.
3. Load considers a deflection limit of  $h/240$ .
4. Values are applicable to either the ASD basic or alternative basic load combinations.
5. Allowable out-of-plane loads for the 12- and 15-inch walls may be linearly interpolated between the axial loads shown.
6. Table loads apply only to single-story walls on concrete foundations.
7. N/A = Not Applicable.

## Axial Capacities for Single-Story Walls on Concrete Foundations

Model Width (in.)	Compression Capacity with No Lateral Loads (lb.)							
	Nominal Height of Shearwall (ft.)							
	7	7.4	8	9	10	11	12	13
12	20,200	19,000	17,200	14,500	11,800	N/A	N/A	N/A
15	25,300	24,200	22,600	20,000	17,400	14,900	12,600	N/A
18	42,500	40,400	37,500	32,900	28,400	24,100	20,200	17,200
21	43,700	41,100	37,500	32,000	26,700	22,000	18,400	15,700
24	51,600	48,800	44,800	38,700	32,900	27,400	22,900	19,500

1. Compression capacity is lesser of wall buckling capacity or 2,500 psi concrete bearing limit.
2. Compression capacity of wall assumes no lateral loads present. See allowable in-plane or out-of-plane load tables for combined lateral and axial loading conditions.
3. Values are applicable to either the ASD basic or alternative basic load combinations.
4. Table loads apply only to single-story walls on concrete foundations.
5. N/A = Not Applicable.

## Allowable Tension Loads for Walls with Wood Jamb Stud

Model Width (in.)	Tension Capacity per Jamb Stud (lb.)							
	Nominal Height of Shearwall (ft.)							
	7	7.4	8	9	10	11	12	13
12	1,535	1,535	1,845	2,150	2,500	N/A	N/A	N/A
15	1,845	2,150	2,460	2,500	2,500	3,070	3,685	N/A
18	1,845	1,845	2,150	2,500	2,500	3,380	3,685	3,980
21	1,845	1,845	2,150	2,500	2,500	3,070	3,685	3,980
24	1,845	1,845	2,150	2,500	2,500	3,070	3,685	3,980

1. Allowable tension load is based on capacity of the lesser of the connection between the stud and the steel shearwall or stud tension capacity. The capacity of the SSW wall anchor bolt and anchorage to the foundation must be adequate to transfer the additional tension.
2. Loads include a 1.60 load duration increase for wood subjected to wind or earthquake. Reductions for other load durations must be taken according to the applicable code.
3. N/A = Not Applicable.

# Anchor Tension Equations

## Calculating Anchor Tension Forces at Base of Wall

These equations may be used to calculate anchor tension forces at the base of the first-story wall to aid designers in developing anchorage solutions other than those shown on pp. 60–67.

$$12 \text{ in. wall } T = [11.2f'_c - \sqrt{126f'_c{}^2 - 2.38f'_c(3.44P + Vhk)}] - P$$

$$15 \text{ in. wall } T = [14.4f'_c - \sqrt{208f'_c{}^2 - 2.38f'_c(4.63P + Vhk)}] - P$$

$$18 \text{ in. wall } T = [18.0f'_c - \sqrt{324f'_c{}^2 - 2.38f'_c(6.13P + Vhk)}] - P$$

$$21 \text{ in. wall } T = [21.6f'_c - \sqrt{465f'_c{}^2 - 2.38f'_c(7.63P + Vhk)}] - P$$

$$24 \text{ in. wall } T = [25.1f'_c - \sqrt{632f'_c{}^2 - 2.38f'_c(9.13P + Vhk)}] - P$$

### Where:

T = Resulting anchorage tension force (kips)

V = Design shear (kips)

P = Total vertical load (kips)

h = Wall height (inches)

f'<sub>c</sub> = Concrete compressive Strength (ksi)

k = 1.0 for all applications except Garage Portal Systems

For Garage Portal Systems using the  
SSWP-KT Portal Kit:

k = 0.80 for SSW12

k = 0.85 for SSW15

k = 0.90 for SSW18

For two-story stacked applications,

substitute M<sub>base</sub> for Vh:

$$Vh = M_{\text{base}} \left( \frac{12}{1000} \right) \text{ kip} \cdot \text{in.}$$

Where M<sub>base</sub> = Design moment at base of wall (ft.-lb.)

### Notes:

- Equations may be used to calculate anchor tension forces at the base of first-story walls on concrete foundations.
- Equations are based on the design methodology contained in AISC Steel Design Guide 1 – Base Plate and Anchor-Rod Design, second edition using a rectangular compression stress block.
- Equations are based on concrete bearing on a 3½"-wide base plate at the edge of the concrete.

### Example 1 — Single-Story SSW

#### Given:

- SSW18x9 wall on 2.5 ksi concrete
- Seismic Loading
- Design Shear (V) = 2.0 kips < 2.15 kips (V<sub>allowable</sub>)
- P (Vertical Load) = 1.0 kip
- h = Wall height = 105.25"
- k = 1.0

$$T = [18.0f'_c - \sqrt{324f'_c{}^2 - 2.38f'_c(6.13P + Vhk)}] - P$$

$$T = [18.0(2.5) - \sqrt{324(2.5)^2 - 2.38(2.5)(6.13 \times 1.0 + 2.0 \times 105.25 \times 1.0)}]$$

$$- 1.0 = 16.9 \text{ kips}$$

Forces at Base of Wall

### Example 2 — Two-Story Stacked SSW Condition

#### Given:

- See Two-Story Design Example on p. 59
- SSW18x9-STK wall on 2.5 ksi concrete
- Wind Loading
- M<sub>base</sub> = 17,550 ft.-lb. (Moment at base of two-story stacked wall)
- Vh = 17,550 x (12/1000) kip-in = 210.6 kip-in.
- P (Vertical Load) = 2.0 kips
- k = 1.0

$$T = [18.0f'_c - \sqrt{324f'_c{}^2 - 2.38f'_c(6.13P + Vhk)}] - P$$

$$T = [18.0(2.5) - \sqrt{324(2.5)^2 - 2.38(2.5)(6.13 \times 2.0 + 210.6 \times 1.0)}] - 2.0 = 16.6 \text{ kips}$$

# Garage Portal Systems on Concrete Foundations

Simpson Strong-Tie offers a Steel Strong-Wall® shearwall option for garage portal systems which combines simplified installation with superior performance.

- Higher allowable loads with reduced concrete anchorage requirements (see *Alternate Garage Front Options* on p. 48 for other options)
- Same anchor bolt template
- Complete kit available to simplify the connection to the header or beam

**For product data and naming scheme information, see pp. 41–42.**

**Suggested Example Specification: SSW12x7 with SSWP-KT**

## Garage Header Rough Opening Height

Model No.	H Curb	Rough Opening Height
SSW12x7 SSW15x7 SSW18x7	5½"	7'-1½"
	6"	7'-2"
SSW12x7.4 SSW15x7.4 SSW18x7.4	0"	7'-1½"
SSW12x8 SSW15x8 SSW18x8	5½"	8'-2¾" <sup>3</sup>
	6"	8'-3¼" <sup>3</sup>

1. The height of the garage curb above the garage slab is critical for rough header opening at garage return walls.
2. Shims are not provided with Steel Strong-Wall.
3. Furring down garage header may be necessary for correct rough opening height.
4. Refer to p. 42 for wall dimensions.

**For a complete set of wall profile drawings, see p. 41.**

## Installation

- Portal Frame Connection Kit is required to achieve increased load values listed for portal frame system.
- SSWPS straps must be installed on exterior face of the Steel Strong-Wall shearwall. Position header flush with exterior face of the Steel Strong-Wall shearwall.
- Do not cut the Steel Strong-Wall or enlarge existing holes. Doing so will compromise the performance of the wall.
- Do not use an impact wrench to tighten nuts on the anchor bolts.
- Maximum shim thickness between the Steel Strong-Wall and header is 7/8" using Simpson Strong-Tie® Strong-Drive® ¼" x 3½" SDS Heavy-Duty Connector screws.
- Walls with 2x4 preattached studs may also be used in 2x6 wall framing. Install the wall flush to exterior face of the framing and add furring to the opposite side.
- Walls may be installed with solid headers in all cases or multi-ply headers in Wind and SDC A-C, see detail 11/SSW2 on p. 70 for details.

## Portal Frame Connection Kit

Model No.	Contents
SSWP-KT	(2) 10-Gauge SSWPS Straps (8) #14 x 1" Self-Drilling Screws Installation Instructions

\*This installation reflects lateral load requirements of a single-wall portal system. It is the designer's responsibility to provide a complete load path for all loads in accordance with the governing codes. Refer to footnotes 2, 4 and 9 on p. 48.

US Patent

	7,500	2,840	0.41	20,365	2,840	0.41	20,365

- Allowable shear loads and anchor tension forces are applicable to Single-Wall Garage Portal System installation on concrete with minimum  $f'_c = 2,500$  psi using the ASD basic (Section 1605.3.1) or the alternative basic (Section 1605.3.2) load combinations. Load values include evaluation of bearing stresses.
- A Double-Wall Garage Portal System consists of two walls with a header continuous across both panels. The allowable load is twice the Single-Wall Portal value.
- For seismic designs based on the 2018 IBC using  $R=6.5$ . For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet steel panels.
- The minimum header size shown in the details is the minimum required for lateral rigidity of the portal system. Larger headers may be required due to vertical loading. Support post uplift connectors may be reduced where justified by calculations.
- Recommended header moisture content is 19% or less at time of installation.
- Allowable shear, drift and anchor tension values may be interpolated for intermediate height or axial loads.
- High-strength anchor bolts are required for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 60–61. High-strength anchor bolts are required for SSW12 when the seismic overturning moment (seismic shear  $\times$  shearwall height) exceeds 61,600 in.-lb. See pp. 60–67 for SSWAB anchor bolt information and anchorage solutions.
- Tabulated anchor tension loads assume no resisting axial load. For anchor tension loads at design shear values and including the effect of axial load, refer to the Strong-Wall Selector web application or use the equations on p. 46 (include  $K$  factor in uplift calculations). Drifts at lower design shear may be linearly reduced.
- Longer header spans can be accommodated if larger headers are used such that equivalent stiffness is equal to or greater than that provided by the minimum header size and maximum length indicated.

## Alternate Garage Front Options

These alternate garage front options may be used for applications when the Steel Strong-Wall® shearwall is installed at the full height (*option 1*) or without the additional Portal Frame Kit (*option 2*), when higher capacity or reduced concrete anchorage are not needed. Refer to the Standard Application on Concrete Foundations on pp. 41–44 for product data and allowable load values.

### For Garage Wall Option 2, the designer shall design for:

- Shear transfer
- Out-of-plane loading effect
- Increased overturning and drift due to additional height

# First-Story Wood Floor Systems

Steel Strong-Wall® shearwalls designed for use on concrete foundations can be used with wood floor systems by extending the anchor bolts and installing compression nuts and solid blocking below the wall.

**Material & Finish:** See p. 41.

**Codes:** ICC-ES ESR-1679;

City of LA Building Code Supplement;

State of Florida FL5113

**For product data and naming scheme information, see pp. 41–44.**

## Wood First-Floor Wall Connection Kit

Wall Width (in.)	Model No.	Contents
12	SSW12-1KT	(1) Shear-Transfer Plate (with #14 self-drilling screws) (2) ¾" or 1" x 18" Threaded Rods F1554 Grade 36
15	SSW15-1KT	
18	SSW18-1KT	(2) Coupler Nuts (2) Heavy Hex Nuts Installation Instructions
21	SSW21-1KT	
24	SSW24-1KT	

1. Two heavy hex nuts included with each wall.

### Blocking/Connection Detail

(See Detail 10/SSW2 on p. 74 for perpendicular blocking where required)

### Alternate First-Story Installation

Installation for first-story wood-floor system. Specify taller wall model to allow for floor framing and use load values for installation on concrete on pp. 43–44.

1. Loads are applicable to first-story raised wood floor installations supported on concrete or masonry foundations using the ASD basic (Section 1605.3.1) or the alternative basic (Section 1605.3.2) load combinations. Load values include evaluation of anchor rod compression capacity and do not require further evaluation by the designer.

2. For seismic designs based on the 2018 IBC using R = 6.5. For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet steel panels.

3. Minimum standard-strength anchor bolts required. See pp. 60–67 for SSWAB anchor bolt information and anchorage solutions.

4. Tabulated anchor tension loads assume no resisting axial load. Anchor rod tension at design shear load and including the effect of axial load may be determined using the Strong-Wall® Shearwall Selector web application or the following equation:

$T = [(V \times h) / B] - P/2$ , where:

T = Anchor rod tension load (lb.)

V = Design shear load (lb.)

h = Strong-Wall height per p. 42 (in.)

P = Applied axial load (lb.)

B = Anchor bolt centerline dimension (in.)

(6⅞" for SSW12, 9¼" for SSW15, 12¼" for SSW18, 15¼" for SSW21, and 18¼" for SSW24)

5. Allowable shear loads assume a maximum first-floor joist depth of 12". For allowable shear load with joists up to 16" deep, multiply table values by 0.93 for SSW12x models and 0.96 for other SSW widths.

6. Allowable shear loads are based on 1,000 lb. total uniformly distributed axial load acting on the entire panel in combination with the shear load. For allowable shear loads at 2,000 lb. uniformly distributed axial load, multiply table values by 0.92 for SSW12x models, and 0.96 for other SSW widths.

# Balloon Framing on Concrete Foundations

Simpson Strong-Tie offers a complete stacked-wall solution for balloon-framing applications. The Steel Strong-Wall® option for heights up to 20' combines simplified installation with superior performance.

- Some of the highest loads in the industry
- Same anchor bolt template as single-story installation
- Complete kit available to simplify the connection between the walls

**Material & Finish:** See p. 41.

# Balloon Framing on Concrete Foundations

## Installation

- Do not cut the Steel Strong-Wall® or enlarge existing holes, doing so will compromise the performance of the wall.
- Do not use an impact wrench to tighten nuts on the anchor bolts.
- Maximum top block height between the Steel Strong-Wall and top plates is 12". See detail 4/SSW3 on p. 77.
- Full height studs are required for balloon-framed wall installation (by designer). Two 2x6 minimum each side with 0.148" x 3" nails at 16" o.c.

Block Height (H)	CS16 Nailing	
	Into Block	Into SSW Nailer Stud
H ≤ 8"	N/A	N/A
8" < H ≤ 10"	(8) 0.148" x 1 1/2"	(8) 0.148" x 1 1/2"
10" < H ≤ 12"	(10) 0.148" x 1 1/2"	(10) 0.148" x 1 1/2"

1. **Fasteners:** Nail dimensions in the table are listed diameter x length.

1. Allowable shear loads and anchor tension forces are applicable to installation on concrete with minimum  $f'_c = 2,500$  psi using the ASD basic (Section 1605.3.1) or the alternative basic (Section 1605.3.2) load combinations. Load values include evaluation of bearing stresses on the foundation and do not require further evaluation by the designer.
2. For seismic designs based on the 2018 IBC using  $R = 6.5$ . For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet steel panels.
3. Allowable shear, drift, and anchor tension values apply to the nominal wall heights listed and may be linearly interpolated for intermediate heights.
4. Solid shim blocks (12" maximum) shall be used to attain specified nominal wall height. See detail 4/SSW3 on p. 77 for additional details.

5. Full-height studs are required for balloon framed wall installation, which must be designed for out-of-plane loads in accordance with the applicable code. Two 2x6 minimum are required on each side and fastened together with 0.148" x 3" common nails at 16 inches on center.
6. Loads are based on a 1,000 lb. maximum axial load acting on the entire panel in combination with the shear load. For shear loads at 2,000 lb. maximum axial load, multiply allowable shears by 0.91 for SSW15x models; no reduction required for other wall models.
7. High-strength anchor bolts are required for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 60–61. See pp. 60–67 for SSWAB anchor bolt information and anchorage solutions.
8. Tabulated anchor tension loads assume no resisting axial load. For anchor tension loads at design shear values and including the effect of axial load, refer to the Strong-Wall Shearwall Selector web application or use the equations on p. 46. Drifts at lower design shear may be linearly reduced.

## Cumulative Overturning

### Key Consideration in Strong-Wall® Shearwall Specification Process

When specifying a premanufactured shearwall for a project, several factors need to be considered, such as load values, seismic/wind requirements, wall width and height, wall placement, etc. Cumulative Overturning is another critical factor often overlooked in multi-story applications.

#### Calculating Cumulative Overturning for Pre-Manufactured Shearwalls

Designers are accustomed to accounting for cumulative overturning when specifying multi-story, site-built plywood shearwalls. However, when specifying premanufactured shearwalls, designers typically calculate shear loads based on the building geometry and code loading requirements. A wall is then selected based on its ability to meet or exceed the required shear load using manufacturer-provided allowable shear load tables.

What can get lost when considering shear capacity only is that the shearwall is not only governed by shear, but also by a combination of other limit states, including *drift*, *tension and compression*, *flexure*, *anchor rod tension*, and *concrete or wood bearing stress*. For single-story walls, the allowable shear given in the load tables is the lowest value of the various limit states. However, additional care must be taken in the analysis of multi-story shearwalls to account for the way the loads are distributed over the height of the building.

#### Cumulative Overturning and Stacked-Wall Applications

In multi-story structures, shear and the associated overturning forces due to seismic/wind requirements must be carried down to the foundation by the building's lateral force resisting system. These forces are cumulative over the height of the building, and shear forces applied at the second or third levels of a structure will generate much larger base overturning moments than the same shears applied at the first story. If cumulative overturning is not considered, the design may result in forces several times higher than the capacity of the lower wall, anchor bolts and foundation anchorage.

When specifying stacked shearwall applications, it's imperative to consider cumulative overturning. The load values for Simpson Strong-Tie® stacked Steel Strong-Wall shearwall applications reflect the impact of cumulative overturning and thus appear significantly different than other shearwall manufacturers.

The effects of cumulative overturning are automatically taken into account when designing shearwalls with the Strong-Wall Shearwall Selector web application. For more information on this design tool, visit [strongtie.com/swss](https://strongtie.com/swss).

**To learn more about cumulative overturning and Simpson Strong-Tie Strong-Wall shearwall testing, visit [strongtie.com/co](https://strongtie.com/co).**

*Simpson Strong-Tie Steel Strong-Wall shearwall rendered in Finite Element Analysis (FEA). When evaluating the performance of complex structural components, our engineers use this computer simulation to complement our full-scale testing program.*

# Cumulative Overturning

## Shear Only vs. Shear and Cumulative Overturning Analysis

The graphic illustration below compares how the total allowable shear load is impacted when the effects of cumulative overturning are included in the analysis. As a point of reference (Figure A), a one-story, nine-foot tall shear wall with a 5,000-lb. lateral load capacity is used. The reference wall has a resulting base overturning moment capacity of 45,000 ft.-lb. and an overturning force of 22,500 lb. assuming a

2 ft. moment arm. As illustrated, if the same base shear is applied over two stories, the overturning at the base of the wall exceeds the one-story application by 60% (Figure B). When proper consideration of cumulative overturning is included in the design, the total allowable shear load on a stacked wall is reduced (Figure C).

	Figure A — One-Story Wall	Figure B — Two-Story Wall	Figure C — Two-Story Wall
	Reference	 Shear Only	 Shear and Cumulative Overturning
			
Total Base Shear Reaction	5,000 lb.  Maximum Shear Capacity	5,000 lb.  Adequate Design for Shear	3,125 lb.  Adequate Design for Shear
Overturning Moment	45,000 ft.-lb.  Maximum Moment Capacity	72,000 ft.-lb.  Exceeds Moment by 60%*	45,000 ft.-lb.  Adequate Design for Moment
Overturning Force (Assumes 2 ft. Moment Arm)	22,500 lb.  Maximum Overturning Force	36,000 lb.  Exceeds Overturning Force by 60%*	22,500 lb.  Adequate Design for Overturning Force

### \*Example calculations:

$(2\text{nd-Story Shear Load} \times \text{Total Story Height}) + (1\text{st-Floor Shear Load} \times 1\text{st-Story Height}) = \text{Overturning Moment} > \text{Baseline Limit of the Lowest Panel}$   
 $(3,000 \text{ lb.} \times 18') + (2,000 \text{ lb.} \times 9') = 72,000 \text{ ft.-lb.} > 45,000 \text{ ft.-lb.}$

$(\text{Overturning Moment}) \div (\text{Moment Arm}) = \text{Overturning Force} > \text{Baseline Limit of the Lowest Panel}$   
 $(72,000 \text{ ft.-lb.}) \div (2 \text{ ft.}) = 36,000 \text{ lb.} > 22,500 \text{ lb.}$

**Note:** Loads shown are for illustrative purposes only. Redistribution of earthquake loads per building code requirements will compound the effects of cumulative overturning.

# Two-Story Stacked-On Concrete Foundations

Simpson Strong-Tie offers a complete stacked-wall solution for two-story applications. This Steel Strong-Wall® Shearwall option combines simplified installation with superior performance.

- Some of the highest loads in the industry and design procedures that account for cumulative overturning, see pp. 54–55 for more information.
- Complete concrete-anchorage designs for two-story applications (*foundation design by designer*)
- No bearing plates to install, walls can now be placed flush against a corner.
- Uses the same anchor bolt template as single-story installation.
- Compression loads transferred by nut/rod — reducing wood crushing under load.

**Material & Finish:** See p. 41.

1. See p. 42 for product data on top wall.

## Two-Story Stacked-Wall Connection Kit

Wall Width (in.)	Model No.	Contents
15	SSW15-2KT	(1) Shear-Transfer Plate (with #14 self-drilling screws) (2) 1" x 48" Threaded Rods F1554 Grade 36 (6) Heavy Hex Nuts Installation Instructions
18	SSW18-2KT	
21	SSW21-2KT	
24	SSW24-2KT	

1. Two heavy hex nuts included with each wall.

### Two-Story Stacked Installation

US Patents 8,281,551; 8,689,518  
Canadian Patent 2,489,845

# Two-Story Stacked-On Concrete Foundations

## Installation Notes

- Do not cut the Steel Strong-Wall® or enlarge existing holes, doing so will compromise the performance of the wall.
- Do not use an impact wrench to tighten nuts on the anchor bolts.
- Maximum shim thickness between the Steel Strong-Wall and top plates is  $\frac{7}{8}$ " using Simpson Strong-Tie® Strong-Drive®  $\frac{1}{4}$ " x  $3\frac{1}{2}$ " SDS Heavy-Duty Connector screws. For additional shim thicknesses, see detail 5/SSW2 on p. 69 and detail 9/SSW2 on p. 73.

Solid blocking under center and each end of wall

### Blocking/Connection Detail

(See detail 8/SSW2 on p. 72 for perpendicular blocking where required)

Drill/notch subfloor to allow nut to sit flush with underside of wall (notching of rim joist may also be required)

Perpendicular floor framing not shown for clarity

Use SSW\_-2KT connection kit to attach standard wall above to "STK" model below

Shim as necessary for tight fit

Attach to top plates with SDS  $\frac{1}{4}$ " x  $3\frac{1}{2}$ " screws (provided)

## Shear-Transfer Plate Fasteners

Strong-Wall Width	Fastener Quantity	
	#14 Screws	10d Nails
15" Wall	4	10
18" Wall	6	12
21" Wall	6	16
24" Wall	7	18

SSW Shear-Transfer Plate installs with 0.148" x 3" nails into the rim joist and #14 self-drilling screws into the Strong-Wall® (sold separately with SSW\_-2KT)

Simpson Strong-Tie® A34 each side (sold separately)

Rim joist

### Exterior View of Shear-Transfer Plate

Install connecting rods before placing 2nd floor wall

### Two-Story Stacked-Wall Connection Detail

Place Steel Strong-Wall over the anchor bolts and secure with heavy hex nuts (provided). Snug-tight fit required, do not use an impact wrench.

- $1\frac{1}{8}$ " wrench/socket required for 1" nut

SSWAB1

### Two-Story Stacked Installation

SSW24x13	1,250	0.48	1,250	0.48

1. Allowable base moment and anchor tension are applicable to installation on concrete foundations with minimum  $f'_c = 2,500$  psi using the ASD basic (Section 1605.3.1) or the alternative basic (Section 1605.3.2) load combinations. Load values include evaluation of anchor rod compression at second story and bearing stresses at foundation.
2. For seismic designs based on the 2018 IBC using  $R = 6.5$ . For other codes, use the seismic coefficients corresponding to light-frame bearing walls with wood structural panels or sheet steel panels.
3. Two-story stacked-wall installations may consist of any height-combination of equal width wall models listed in these tables.
4. Loads are based on a 1,000 lb. maximum uniformly distributed total axial load acting on the second-story panel and a 2,000 lb. maximum uniformly distributed total axial load acting on the first-story panel in combination with the tabulated shear load and base moment.
5. The designer must verify that the cumulative overturning moment at the base of the first-story Steel Strong-Wall® does not exceed the allowable base moment capacity. See design example on p. 55 for procedure.
6. The allowable second-story shear loads assume a maximum floor joist depth of 14". For allowable shear load with up to 18" joists, multiply second-story allowable shear loads by 0.98 for SSW15x models and by 0.94 for other SSW widths. For bottom wall shims greater than 7/8" thick, see detail 9/SSW2 on p. 73.
7. Allowable shear, drift, and base moment values may be interpolated for intermediate heights.
8. Minimum ASTM F1554 Grade 36 threaded rods are required at the second-story wall anchorage.
9. High-strength anchor bolts are required at the first-story wall for anchor tension forces exceeding the allowable load for standard-strength bolts tabulated on pp. 60–61. See pp. 60–67 for SSWAB anchor bolt information and anchorage solutions.
10. Tabulated anchor tension loads assume no resisting axial load. For anchor tension loads at design shear values and including the effect of axial load, refer to the Strong-Wall Selector web application or use the equations on p. 46. Drifts at lower design shear or base moment may be linearly reduced.

# Two-Story Stacked-On Concrete Foundations

## Two-Story Design Example

### Example: Standard Two-Story Wall Design

#### Given:

Wind,  $f'_c = 2,500$  psi

$V_{2\text{nd-story wall}} = 650$  lb.

$V_{1\text{st-story wall}} = 650$  lb.

$V_{\text{total}} = 650 \text{ lb.} + 650 \text{ lb.} = 1,300$  lb.

$M_{\text{allow}} = \text{Allowable ASD Base Moment (ft.-lb.)}$   
 (See *Two-Story Stacked Tables*)

$V_{\text{allow}} = \text{Allowable ASD Shear Load V (lb.)}$   
 (See *Two-Story Stacked Tables*)

#### Step 1 – Select First-Story Wall (See tables on p. 58)

$M_{\text{base}} = (650 \text{ lb.} \times 18 \text{ ft.}) + (650 \text{ lb.} \times 9 \text{ ft.}) = 17,550 \text{ ft.-lb.}$

Using First-Story Wall Table, select a 9-foot wall with  $M_{\text{allow}} \geq M_{\text{base}}$

Select SSW18x9-STK

$M_{\text{allow}} = 22,685 \text{ ft.-lb.} > 17,550 \text{ ft.-lb.}$  **OK**

#### Step 2 – Check Second-Story Wall

Using the Second-Story Wall Table on p. 58, check the capacity of an 8-foot wall with the same width as the First-Story Wall selected in Step 1:

Select SSW18x8

$V_{\text{allow}} = 1,315 \text{ lb.} > 650 \text{ lb.}$  **OK**

**>>> Use SSW18x8  
over SSW18x9-STK**

## Cold-Formed Steel on Concrete Foundations

The Steel Strong-Wall® provides high-capacity, narrow-wall solutions for cold-formed steel (CFS) framing. Wall models for this application, designated by the S/SSW model prefix, install easily in CFS framing, and preattached steel studs allow easy attachment of interior and exterior finishes. Simpson Strong-Tie offers Steel Strong-Wall solutions for standard CFS applications on concrete, first-story floor systems, and two-story stacked applications on concrete.

### Cold-Formed Steel Connectors

All of the design, specification and installation information you need on our Steel Strong-Wall for CFS applications can be found at [strongtie.com/cfs](http://strongtie.com/cfs).

**Cold-Formed Steel Applications  
(Standard, Raised Floor and Two-Story)**

# Steel Strong-Wall® Anchorage Solutions

## SSWAB Anchor Bolts

SSWAB anchor bolts in ¾" and 1" diameters offer flexibility to meet specific project demands. Inspection is easy; the head is stamped with a No-Equal® symbol for identification, bolt length, bolt diameter, and optional "HS" for High Strength if specified.

**Material:** ASTM F1554

Grade 36; High Strength (HS)  
ASTM A449

An additional nut for template installation is provided with each SSWAB. It may also be used for SSW installation.

## SSWHSR Extension Kit

SSWHSR allows for anchorage in tall stemwall applications where full embedment of an SSWAB into the footing is required. The head is stamped for identification like an SSWAB. Kit includes ASTM A449 high-strength rod with heavy hex nut fixed in place and high strength coupler nut. Do not use in place of SSWAB.

- See pp. 63–64 for foundation illustrations showing W and d<sub>e</sub> dimensions.
- Anchorage designs conform to ACI 318-14 Chapter 17 and ACI 318-11 Appendix D with no supplementary reinforcement and cracked or uncracked concrete as noted.
- Anchor strength indicates required grade of SSWAB anchor bolt. Standard or High-Strength (HS).

- Seismic indicates Seismic Design Category C through F. Detached 1 and 2 family dwellings in SDC C may use wind anchorage solutions. Seismic anchorage designs conform to ACI 318-14 Section 17.2.3.4.3 and ACI 318-11 Section D.3.3.4.
- Wind includes seismic design category A and B and detached one- and two-family dwellings in SDC C.
- Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by designer. The registered design professional may specify alternate embedment, footing size or anchor bolt.

# Steel Strong-Wall® Anchorage Solutions

Foundation shear reinforcement to resist shear forces from Strong-Wall shearwalls located at the edge of concrete is shown in the table below. The SSW12 and SSW15 used in wind applications do not require shear reinforcement when the shearwall design shear force is less than the anchorage allowable shear load shown in the table below.

## Shear Anchorage Solutions

Model No.	$L_t$ or $L_h$ (in.)	Seismic <sup>3</sup>		Wind <sup>4</sup>		ASD Allowable Shear Load $V^6$ (lb.)			
		Shear Reinforcement	Minimum Curb/Stemwall Width (in.)	Shear Reinforcement	Minimum Curb/Stemwall Width (in.)	6" Minimum Curb/Stemwall		8" Minimum Curb/Stemwall

SSW21	15	(2) #3 Hairpins	8 <sup>5</sup>	(1) #3 Hairpin	6				
SSW24	17	(2) #3 Hairpins	8 <sup>5</sup>	(1) #3 Hairpin	6				

1. Shear anchorage designs conform to ACI 318-14 Chapter 17 and 318-11 and assume minimum  $f'_c = 2,500$  psi concrete. See pp. 60–61 for tension anchorage.
2. Shear reinforcement is not required for panels installed on a wood floor, interior foundation applications (*panel installed away from edge of concrete*), or braced-wall panel applications.
3. Seismic indicates Seismic Design Category C through F. Detached 1 and 2 family dwellings in SDC C may use wind anchorage solutions. Seismic shear reinforcement designs conform to ACI 318-14 Section 17.2.3.5.3 and ACI 318-11 Section D.3.3.5.
4. Wind includes seismic design category A and B and detached one- and two-family dwellings in SDC C.
5. Where noted minimum curb/stemwall width is 6" when standard-strength SSWAB is used.
6. Use (1) #3 tie for SSW12 and SSW15 when the Steel Strong-Wall design shear force exceeds the tabulated anchorage allowable shear load.
7. No. 4 grade 40 shear reinforcement may be substituted for SSW shear anchorage solutions.
8. The registered design professional may specify alternate shear anchorage.

## Stemwall Extension Installation

## Steel Strong-Wall® Anchor Bolt Layout

Model No.	Distance from End of Wall to Center of SSWABs, A (in.)	Distance from Center to Center of SSWABs, B (in.)	Distance from Exterior Face of Wall to Center of All SSWABs, C (in.)
SSW12	2 $\frac{1}{16}$	6 $\frac{7}{8}$	2
SSW15	2 $\frac{7}{8}$	9 $\frac{1}{4}$	1 $\frac{7}{8}$
SSW18	2 $\frac{7}{8}$	12 $\frac{1}{4}$	1 $\frac{7}{8}$
SSW21	2 $\frac{7}{8}$	15 $\frac{1}{4}$	1 $\frac{7}{8}$
SSW24	2 $\frac{7}{8}$	18 $\frac{1}{4}$	1 $\frac{7}{8}$

# Steel Strong-Wall® Anchor Bolt Templates

Simpson Strong-Tie has developed a reusable anchor bolt template for common foundation types for the Steel Strong-Wall. The templates help to accurately locate the SSWAB preassembled anchor bolts, which simplifies installation and greatly reduces the chances of voids in the concrete. In addition, Simpson Strong-Tie offers anchor bolt stabilizers that enable the Steel Strong-Wall anchorage to be installed without being tied to the footing rebar cage by helping to eliminate movement of the anchor bolts during concrete placement. Two bolt stabilizers are used for each SSW anchor assembly; one at the embedded plate washer and the other above the template. Half-inch diameter dowels (not supplied) are then driven down through the bolt stabilizers and into the ground to ensure plumb installation of the anchors and prevent movement during concrete placement. Immediately following concrete placement, the dowels are removed and reused in other locations.

## Anchor Bolt Templates

Steel Strong-Wall Model No.	Width (in.)	Anchor Bolt Stabilizer Model No.	Steel Strong-Wall Template Model			
			Reversible	Panel Form	Brick Ledge	Extended Leg
SSW12	12	SSWBS12	SSWT12	SSWTPF12	SSWTBL12	SSWTEL12
SSW15	15	SSWBS15	SSWT15	SSWTPF15	SSWTBL15	SSWTEL15
SSW18	18	SSWBS18	SSWT18	SSWTPF18	SSWTBL18	SSWTEL18
SSW21	21	SSWBS21	SSWT21	SSWTPF21	SSWTBL21	SSWTEL21
SSW24	24	SSWBS24	SSWT24	SSWTPF24	SSWTBL24	SSWTEL24

1. The height of the garage curb above the garage slab is critical for rough header opening at garage return walls.
2. See Garage Header Rough Opening Height table on p. 47.
3. Templates are recommended and are required in some jurisdictions.
4. Foundation design by designer.
5. Reversible, panel form and brick ledge templates are the same for 4"- or 6"-thick walls.

An additional nut for template installation is provided with each SSWAB. It may also be used for SSW installation.

Optional T-shape dowel by others.)

# Anchor Reinforcement Solutions on Grade Beams

Simpson Strong-Tie now provides grade beam anchorage solutions for the Steel Strong-Wall®, which have been calculated to conform to ACI 318-14. Through funding from the Structural Engineers Association of Northern California, initial testing at Scientific Construction Laboratories Inc. confirmed the need to comply with ACI 318 requirements to prevent plastic hinging at anchor locations. Follow-up testing at the Simpson Strong-Tie Tyrell Gilb Research Laboratory was then used to confirm these findings and validate performance. The testing consisted of specimens with closed tie anchor reinforcement, non-closed u-stirrups and control specimens without anchor reinforcement. Flexural and shear reinforcement were designed to resist amplified anchorage forces and compared to test beams designed for non-amplified strength level forces. The test program has proven the performance of the anchor reinforcement details developed by Simpson Strong-Tie.

## Significant Findings from Testing

Grade beam flexural and shear capacity is critical to anchor performance and must be designed to exceed the demands created by the attached structure. In wind load applications, this demand includes the factored demand from the Steel Strong-Wall (SSW) shearwall. In seismic applications, testing and analysis have shown that in order to achieve the anchor performance expected by ACI 318 anchorage design methodologies, the concrete member design strength needs to resist the amplified anchor design demand from ACI 318-14 Section 17.2.3.4.3 and ACI 318-11 Appendix D Section D.3.3.4.3. To help designers achieve this, Simpson Strong-Tie recommends designers apply the seismic design moment listed in the table below at the SSW location when evaluating the grade beam design strength under seismic loads. The tabulated moment correlates to the lowest of the anchor tension design limits defined in the sections listed above as they relate to each SSW model.

Closed tie anchor reinforcement is critical to maintain the integrity of the reinforced core where the anchor is located. Testing with u-stirrups that did not include complete closed ties showed premature splitting failure of the grade beam.

Grade Beam Testing

## Steel Strong-Wall Grade Beam Anchorage Solutions

Steel Strong-Wall Model No.	Anchor Bolt Model No.	Anchor Diameter (in.)	Anchor Reinforcement for Wind and Seismic		Amplified LRFD Applied Design Seismic Moment (ft.-lb.)	
			Standard-Strength SSWAB	High-Strength SSWABHS	Standard-Strength SSWAB	High-Strength SSWABHS
SSW12	SSWAB¾	¾	(2) #4 Closed Ties / Wall	(5) #4 Closed Ties / Wall	16,700	23,000
SSW15	SSWAB1	1	(4) #4 Closed Ties / Wall	(7) #4 Closed Ties / Wall	37,000	44,000
SSW18			(2) #4 Closed Ties / Anchor	(4) #4 Closed Ties / Anchor	48,700	61,000
SSW21					60,300	77,000
SSW24					72,000	87,000

- Anchor reinforcement conforms to ACI 318-14 Section 17.2.4.9 and ACI 318-11, section D.5.2.9. Full-scale testing was used to validate anchor reinforcement configuration and placement.
- Minimum concrete compressive strength,  $f'_c = 2,500$  psi.
- Closed-tie anchor reinforcement to be ASTM A615 Grade 60 (min.) #4 rebar.
- Grade beam longitudinal and tie reinforcement shall be specified by the registered design professional for flexure and shear loading. Design should consider project specific design loads and allowable soil pressure.
- Simpson Strong-Tie recommends using the tabulated minimum LRFD-applied seismic design moment to ensure grade-beam design flexure and shear strength is adequate to prevent plastic hinge formation under demands associated with anchorage forces corresponding to ACI 318-14 Section 17.2.3.4.3 and ACI 318-11, Section D.3.3.4.3.
- Designer may use reduced moment due to applied SSW lateral load. Minimum moment shall be the lesser of the tabulated moment or the amplified LRFD design moment for seismic:  $(ASD \text{ design demand Shear}/0.7) \times \Omega_o \times SSW \text{ height for grade beam design}$ .
- Minimum grade beam design moment for wind and seismic in Seismic Design Category A and B and detached one- and two-family dwellings in SDC C:  $(ASD \text{ design demand Shear}/0.6) \times SSW \text{ height}$ .
- Closed tie may be single piece hoop or two piece assembly with a u-stirrup with 135 degree hooks and a top cross tie cap. See detail 6/SSW1.1.
- See details for grade-beam anchor reinforcement placement, installation and spacing requirements. Closed-tie anchor reinforcement quantity is per wall for the 12" and 15" wall models, and per anchor for the 18", 21" and 24" models.
