[Environmental Responsibility](#)

As a manufacturer, USG recognizes the importance of safeguarding the environment. Our solid history of environmental responsibility includes providing product solutions that reduce environmental impact, reduce waste, conserve resources and recycle materials whenever possible. We not only use abundant resources such as perlite and gypsum but also use alternative resources, such as renewable agricultural sources, to obtain raw materials for our building products. This allows us to preserve valuable natural resources while supporting clean air and easing disposal problems for public utilities. Our gypsum plants recycle plant waste back into the manufacturing process, and USG also manufactures products that are environmentally acceptable, safe and effective when used as intended. Additionally, USG has been active in a variety of environmental organizations for many years, including helping to establish in 1993 the U.S. Green Building Council, a diverse coalition of principal groups involved in the building industry dedicated to promoting energy, health, productivity and environmental improvements for "whole buildings."
