Overview

Versico’s Molded PVC Sealant Pockets consist of an interlocking, two-piece, injection-molded flexible pocket with a rigid PVC vertical wall and pre-formed deck flanges. Pockets can be adjusted from 11½” (292 mm) to 7½” (190.5 mm) in length by following the cutting lines molded into the pocket. This product, in conjunction with White One-Part Pourable Sealer, is used to waterproof pipe clusters or other oddly shaped penetrations on VersiFlex Roofing Systems.

Versico’s VersiFlex PVC Molded Sealant Pockets are part of the Certified Fabricated Accessory (CFA) program. Certified Fabricated Accessories are the only factory-fabricated PVC accessories that meet the stringent quality tolerances required to be included in a Versico warranted roofing system.

Features and Benefits

- Provides substantial labor savings compared to field-fabricating a sealant pocket from coated metal or other material
- Provides a reliable method to permanently waterproof oddly shaped penetrations
- Built in extension legs allow varying sealant pocket sizes
- Provides a more consistent, professional appearance than field-fabricated pockets

Installation

1. Clean the inside of the Molded PVC Sealant Pocket as well as the areas where the pocket overlaps, (the underside of the pocket flange and the deck membrane) with PVC Membrane Cleaner. Use an abrasive pad with the cleaner if the membrane has been exposed for an extended period of time.
2. Place the Molded PVC Sealant Pocket around penetration(s), overlapping the two sections of the pocket.
3. Cut a piece of cardboard (approximately 4” x 4”) and place between the overlapping area of the Molded PVC Sealant Pocket and the deck membrane. The cardboard prevents the pocket from welding to the membrane when first welding the overlaps.
4. Position the Molded PVC Sealant Pocket so the vertical overlap is against the penetration. This will allow proper pressure to be applied to the overlap with the 2" silicone roller.
5. Weld both vertical overlaps starting at the angle change and progressing to the top of the pocket.
6. Using a hand-welder, weld the angle change in overlap area first. Using the end of a seam probe assists in this process. (The hand-welder temperature setting should be between 5 and 6.)
7. Hand-weld the remainder of the horizontal overlap.
8. Repeat steps 4 and 5 to weld the overlap on the other side of the Molded PVC Sealant Pocket.
9. Make tack-welds on all four sides of the pocket to hold it in place.
10. Weld the entire horizontal flange to the deck membrane.

11. Once the weld area is completely cool, check all splices for voids and cold-welds with a seam probe. Make any needed repairs.

12. Fill the pocket with White One-Part Pourable Sealant. Use an adequate amount of sealant to ensure that contact is made with the top rim of the pocket.

REVIEW CURRENT VERSICO SPECIFICATIONS AND DETAILS FOR SPECIFIC APPLICATION REQUIREMENTS.

Precautions

1. Temperature of penetration shall not exceed 160°F (71°C).

2. The inside of the sealant pocket and all penetrations must be cleaned with PVC Membrane Cleaner prior to filling with sealant. No primer is to be used.

3. White One-Part Pourable Sealer must completely fill the Molded PVC Sealant Pocket and must be crowned to prevent ponding water.

4. The walls of the sealant pocket must be a minimum of 1" from any penetration.

5. Store Molded PVC Sealant Pockets in a cool, shaded area and cover with light-colored, breathable, waterproof tarpaulins. Molded PVC Sealant Pockets or membrane that have been exposed to the weather must be prepared with PVC Membrane Cleaner prior to hot-air welding. (Abrasive pads must be used if the membrane has been exposed for an extended period of time.)
