CERAMAR® PRESSURE RELIEF

Flexible Foam Pressure Relief Joint

DESCRIPTION

CERAMAR PRESSURE RELIEF is a flexible foam joint filler composed of a unique, synthetic foam of isomeric polymers in a very small, closed cell structure. Gray in color, the product is lightweight, flexible, highly resilient, and offers recovery qualities of over 99%.

USES

CERAMAR PRESSURE RELIEF can effectively relieve pavement pressure and thus help prevent destruction of rigid pavements. Its compact, closed cell structure offers an almost nil water absorption quality. The product may be sealed with either cold-applied or hot-pour sealing compounds. The product provides a very effective way to stop highway blowups and pavement shattering.

FEATURES/BENEFITS

- Offers high resistance.
- User friendly, lightweight, flexible foam ... forms or wraps around curved or circular surfaces.
- Offers high resiliency and 99% recovery qualities ... low compression values ... non-extruding ... minimal water absorption.
- Resists ultraviolet degradation ... will not rot or deteriorate.

PACKAGING

4 1/2" x 8" x 12' per piece

TECHNICAL DATA

Compression, 50%	13.3 psi
Extrusion	0.1"
Recovery	99.21%
Water Absorption, Volume %	0.246

1/2" test specimen; test method – ASTM D-545

APPLICATION

Joint Preparation ... Cut a straight, accurate joint with parallel sides to receive CERAMAR PRESSURE RELIEF. Joint should be 4" wide and full depth of the concrete pavement. The interfaces of the joint are to be clean, dry, and free of obstructions or projections.

Note ... In new construction, the design authority must anticipate all shrinkage and/or expansion and compensate for same when establishing width of formed joint. After curing, shrinkage, etc., joint width should not exceed 4" maximum.

Installation ... To install CERAMAR JOINT RELIEF, place the corner of the plank at the end of the joint. Hold the plank at an approximate angle of 45° and apply pressure to the material. Complete insertion may be accomplished by tamping with a sledgehammer or walking it down. If additional pressure is required to completely insert CERAMAR PRESSURE RELIEF, utilize any method or equipment that will exert sufficient downward pressure to complete the insertion without damaging the joint material. Adjoining planks should be tightly butted together. Insert CERAMAR JOINT RELIEF so that the surface of the material will be approximately 1/2" below the surface of the pavement. When the material is to be over-sealed, insert to the depth specified by the design authority to provide a proper reservoir for the sealing compound. Should it be desired or necessary, CERAMAR PRESSURE RELIEF may be easily cut to size using conventional hand saws. A lubricant adhesive, such as POINTING MASTIC from W. R. MEADOWS, may be used to aid in placing the material and also to help hold it in place.

PRECAUTIONS

It is absolutely necessary that CERAMAR PRESSURE RELIEF be installed under compression to maintain proper positioning. Width of the joint should be accurately cut to assure a proper compression fit of the material. Insertion in
